: Is that a known limitation or am I reporting a bug?

Well, maybe it doesn't like "flicker mode." Try turning it off. It works great in 800x600x256 with Falcon Screen on my Falcon. What EXACTLY does it do? Do the dialogs look right?

: 'Part from that, first impressions very positive.

Thanks!

If you don't need low profile, you can buy adapters which will convert
PLCC to PGA. If the number of pins is small enough, a standard PLCC
socket will usually map directly onto the PGA equivalent.

> AT ACN.
>
> Any other people with ACN problems? It is time to take some (legal)
> action against these people.

I am the sole Swedish distributor for FastCopy PRO, and I trade directly with ACN. A must admit that they have been somewhat slow at times, but not always!

For a good personal contact, I'd recommend that you turn to Willem Hartog. He's the guy in charge of the magazine they produce, and he is a very helpful chap.

Small tip: ACN are sometimes hard to reach over the phone, but try calling between 21.00 and 01.00 - these guys work nights!

Yours sincerely

This is a VERY STUPID WAY TO DO THIS, thier is a very simple way...

Get hold of DC Formator 3.3 I think it is, there is a option to make floppy
bootable boot sectors, select the one listed as BYPASS HARD DRIVE, and write
this to a floppy...

Also have on this floppy disk a copy of the Hard Disk booter, I have the ICD
one in the Auto folder and Drive Icon C: saved on this disk, Desktop.inf
file..

Its that simple...

The other way is to use a Boot Manager, if fact if you are using a Hard Drive
you Must use a Boot Manager....

I have the same problem with my standard ST mouse which is, at least in my case,
caused by faulty connections where the mouse lead goes into the 9 pin (?) female
connector of the mouse. Try and move the mouse while wiggling the lead in all
directions and see if that helps.

It is possible to use PC mice provided that you install a serial mouse driver
(software), but perhaps an easier path would be to buy a new ST mouse or an
Amiga mouse. A lot of Amiga replacement mice have a switch that allows it to
be used as an ST mouse (otherwise you'll have to rearrange the wiring inside
the mouse (Two pins I think, but I don't know which! I'm sure someone in this
newsgroup can direct you to some document on the net describing this
procedure.))

Good luck and best regards,

Nils.

Source record: 168382

Some Hd drivers like the Protar ones allow you to select an alternative boot drive on startup. This means that once the system has booted off the floppy you have to tell the system to find the Hd (easy if you have TOS 2.06) and then rip out the offending acc.

I found that the best way was to put the prog on a floppy and use that as the boot device for testing.

I managed to do a similar thing when developing a Boot password program!!

Steve

I use ZOO.TTP as an installed application. I set argument as '-extract '
(note the space - this is essential), the directory to 'application' and
parameter as 'full path'. Double-clicking on a 'ZOO' file then extracts
to the ZOO.TTP directory. Since I use a Falcon (and thus NEWDESK), I
can't say whether DESKTOP will allow this.

13. Re: FAX: Groups and Classes

Newsgroup: comp.sys.atari.st
Date: 1995-04-01 00:00:00 UTC
From: dcohen@cix.compulink.co.uk
Message-ID: <D6CI5G.646@cix.compulink.co.uk>
Source record: 168386

Thanks for the information about Fax classes and groups, Hendrik.

I spoke too soon when I said that I had got CoMa working with my Sportster 14400. It sent a fax successfully ro one number when speed was reduced from 9600 to 7200, but still refuses to send to the fax machine at work, even with the lower speed. The problem seems to be that it establishes a connection, appears to send the text, and after the text has been sent it then times out (I kept a protocol file, which finishes with the lines

send page 1
last page end
timeout
and then vbarious modem resets).

Any ideas?

And while I'm asking, does anyone know how to use the QFax driver in That's Write 3? Every setting I've tried just gives the message "Output error".

Yes that is the other BIG problem with COMA its cost more than a commercial program.

I thought shareware was supposed to be cheaper, farr less costs in Marketing it and no ripoff distributors...

Or is it just these gready Germans again, I do find German prices way out of line with the rest of the world...???

J-Office is way behind COMA, I would place J-Office at a 2 and COMA at a 11, and that is out of 10...:-)

But then it costs nothing to try out J-Office...

17. Moniterm w/1040STf?

Newsgroup: comp.sys.atari.st
Date: 1995-04-01 00:00:00 UTC
From: rcooper@r-node.io.org
Message-ID: <3lipka$q56@ionews.io.org>
Source record: 168390

I'm curious if it is possible (regardless of how much work is involved) to connect a Moniterm Viking monitor to a stock 1040ST. I've been told that a German ST magazine had an article that detailed how to connect a Mega Bus to a standard ST motherboard, which would (theoretically) allow me to use the Moniterm video card, yes?

Any information would be greatly appreciated!

Rob - <<< rcooper@io.org >>>

>my articles.

Some notes about snapshots:
I've found that grabbing frames from Cubase Audio is impossible without
XIMG.LZH (snapshot) by Eero Tamminen. It's the only one I know that can save
a big screen without using any memory (CAF takes over all the memory).
There's also a program called FRACTxxx.PRG that comes with Selectric, that
makes a protected memory area (of user defined size) for ACC's that need
sometimes more memory, but it's a messy way to do it as it does not let
any normal program use it's memory.

Thought you'd like to know,

Best Regards,

19. Monitors, TTL/ANALOG/what

Newsgroup: comp.sys.atari.st
Date: 1995-04-01 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <04011995.210929@empyr.dircon.co.uk>
Source record: 168392

Hi,

I've picked up a bunch (6) of monitors from an electronics junk shop. One is VGA, another EGA, two have Analogue and TTL inputs / switches, and the last two I'm not sure about.

I'm hoping that one of them might work, BUT, as I don't have a PC to plug them into, can I test them with my Atari ST ?

If so, how do I connect them up to my ST ?

I would be very grateful if anyone could help me with this.

Thanks in advance,

Kevan

SOL now can run in mediun now. Thats why runlow won't work.

>the SCSI II, it just wouldn't be as fast as a SCSI II device.
>

First of all. SCSI-II got nothing to do with the speed, Advanced (FAST,WIDE)
SCSI-II does though, but the Falcon doesn't support these.
SCSI-II is simply a extra set of commands, which an SCSI-II Host can read.

As far as your question goes, any SCSI device should run fine on your
Falcon, cause even though you may buy a SCSI-I device, SCSI-II is still
backward compatible.

: >change the setting in the control panel to 16 Mhz with cache, then save
: >it and close the control panel. When I re-open the control panel, it
: >says 8 MHz again! Am I missing something here???

: I am also using a utility, fast.prg, that does 16MHz + cache on bootup and
: have no problems with it. You can actually see the difference running between
: 8 and 16 Mhz, so there is no need for any other programs.

: Are you using some sort of auto config selector like Xboot or Superboot? They
: will over write your newdesk.inf with their saved version. This is just a wild
: guess. Also Xboot can switch your CPU speed / blitter. My problem was my
: problem when I first used Xboot, it kept turning off my blitter.

: William

Are you perhaps using the Before Dawn screen Saver (version 1.25
and possibly even 1.39)? My Mega STe was booting up in 16mhz+cache fine
until I had installed it. Then it would keep booting in 8mhz. Before
Dawn is nice and all, but I'd prefer the speed and a crappy screensaver.

: Christopher Goosman/PO Box 2871/Ann Arbor, MI/48106-2871
: goose@umcc.umich.edu

Welcome to the world of atari. To answer your questions, yes, you can
get 14.4k and higher (although higher requires a patch program because of
aweful RTS/CTS handshaking). There are plenty of PD or Shareware
Terminals (TAZ, ConNect, ANSITerm 1.90, to name some of the best and most
used) and Word processors (7up, edith, Everest.)

24. SLIP/PPP for ATARI ST ????

Did you find a solution for the "wraparound" bug in monochrome? I have
wrapfix.prg and it works for Cad.3D2 but unfortunately not for FS2
or MonST2C. (Kellermeister, there is a bug in my debugger! :-))

TwiLight is a commercial program and costs 70DM. Fortunately an
English version is available. I _highly_ recommend it. It's the best
screensaver I've ever seen, and I don't regret that I got it. I have a
demo of it, do you want me to UUE you a copy so you can check it out?

You can get replacement cables, the old Atari agent in Wellington had them in stock and PC cable firm has them also....

You could get a better mouse, I use a Golden Image one, I did here that the Logitec Pilot mouse was also good...

Amiga mice can also be used if 2 wires are changed over.....

Message-ID: <3lm063$3k6@golem.wcc.govt.nz>
Source record: 168307

Well before you jump on me I do sugest you go read AEO 404...

Atari has no Falcons in stock and is not making any more...

Also the German C-Labs Falcon is way way over priced
at $3000US and has very little new features or fixed,
in fact all of the features and mods can be fitted
to a standard Falcon for far less money...

To the People that tell me to upgrade to a Falcon, Atari computers
are not sold in this part of the world and have not been for 1-2 years..

Even if you did import one, thier are no shops selling Software and if it
breaks down it will have to end up in the rubish bin, Atari parts are not
easy to get hold off and no one would fix it......

For a way over priced machine that risk is far to high...

Hi all,

I was able to get Mint, XFS, and all up on a 44 meg partition on my 4 meg TT. My problem is that when I try to run X it comes up using about 1/4 of my screen. I have an 'X' for a cursor but can't see or do anything. This is in TT-med resolution. I thought I read that X only ran in mono and if so how do I set up to boot MiNT in mono and get this thing running.

Source record: 168311

Some time ago *somebody here* mentioned a terminal that could emulate
a TEK 4010 other than Uniterm. What was it? Does it work?

I have a problem with Uniterm and Tek. The vectors get corrupted "on line"
(looks scrambled) but when I zoom into the drawing everything is allright??
All lines are send and recieved with the correct coordinates.

So my server is OK, my modemconnection is OK but Uniterm is not..

Is anybody else actually using tekcode anymore? (could be great stuff for
doing that 3D game on your favourite obsolete mainframe :)

/Jens M Andreasen

33. PROFILE2 v2.12 release

From: msbaines@cix.compulink.co.uk
Message-ID: <D6F1zx.DIF@cix.compulink.co.uk>
Source record: 168312

PROFILE 2 THE system analyser for all Ataris has just got better!

This is the most comprehensive system analyser available and fully compatible with all Atari machines and TOS-based operating systems including the Falcon and GEMulator run on a PC. It is also MultiTOS, MagiC, MagiCMac and Geneva compatible.

V2.12 has been released and is available from:
CIX in the atari.st/ 2listings topic file list
HENSA (via ftp, telnet, gopher at micros.hensa.ac.uk in the /micros/atari/tos directory)
Paderborn in Germany (ftp.uni-paderborn.de in the /atari directory).
PD libraries, Nest, TurboNet, AtariNet and FidoNet networks shortly.

There are many changes, developments, bug fixes and new pages.

This version is a big improvement on v2.08 and especially important for MagiC, MagiCMac, Geneva and MultiTOS users.

MagicMac, an excellent Atari emulator which *will* run your Atari s/w
faster than your Mac will run your Mac s/w! At least, Papyrus under
MagicMac scrolled far faster than Word did.

Available from System Solutions for about £120.

Phil.

TeleOffice (_not_ JuniorOffice!), installed as an ACC, can do this via
T_OFFICE.CPD and a tiny prg in the AUTO-folder (name has slipped my mind).

BTW, TO comes with _loads_ of drivers for all sorts of applications ...

But one could always "print" into an image, and load this *.img into ones
favourite facsilmile-application. Calamus comes with *TOIMG.CPD* which is very
helpful for such things.

For further information about TeleOffice contact TKR at their CI$-account:

100342.1702@compuserve.com

Mr. Helge Riis is the right person to talk to.

Well I've used an XT PSU as a replacement for a TT one. Works very well.

> I noticed that the Atari has two 5v pins on the power supply. Does
> this mean that these need to be two separate, i.e. isolated 5v
> outputs, one of them could be taken from another output plug of the
> AT power supply?

I suspect they can be taken from the same 5V supply. I can see no reason
why they should be isolated in anyway.

> I would like to hear from anyone who has done this and if there are
> any problems or pitfalls.

The only thing I found was that my XT PSU didn't regulate unless a certain
load was put on the 5V line. Therefore I wired up a resistive load and
attached its heatsink to the side of the PSU case to keep it cooler.

A modern AT PSU shouldn't have this problem - though always check voltages
before plugging anything in.

In general though - make very sure you check and double check everything.
Its easy to make an expensive mistake.

:-)

Roland.

42. MiNT on what machine ?

Newsgroup: comp.sys.atari.st
Date: 1995-04-02 00:00:00 UTC
From: polom@matrix.fdn.fr
Message-ID: <2083578@matrix.fdn.fr>
Source record: 168321

Could somebody tell me if I could install MiNT on my ST ?
I have a STe with 2 megs and let's say 15Mo on my HD.
Will it work on a "simple" STe ?
Where can I find that ?
What things are absolutely necessary to run MiNT ?
What about Minix ? Is it the same ?
Thanx in advance.

Hi!

In german ATARI magazine "ATARI Inside" I saw a small article about a graphical editor for the POV-Raytracer. Even though I don't think this mag is very reliant (and it was the April issue :-) I really would like to know if such a prog exists and where I could find it. BTW, it was a french program. (I know that there are lots of editors available for the pc.)

Any idea?

From: kghashgh@nermal.santarosa.edu
Message-ID: <3lkpen$55d@floyd.santarosa.edu>
Source record: 168395

I've been kinda learning C from a book lately. I need a little help in regard to graphics. Is the location of video memory always the same? Basically, I'd just like to know what the address is, or how to set it, or whatever.

Also, I'm using Sozobon C, and the book that I'm using to learn C only briefly mentions how to access memory in bits rather than full bytes or more, but the method mentioned in the book doesn't seem to work in Sozobon. Any help here?

Thanks in advance

Imagecopy can be set to reserve memory at boot time which gets around this
problem. WIth XIMG there's no way of grabbing dialogs or menus.

I have the following few Atari-related items to sell. They are collecting
dust and need a good home. The prices are just suggestions. Please feel
free to make offers! Everything will go for best offer, but I'd be really
happy if someone will take it all! Please take this stuff off my hands. :)

TOS 1.2: 2-chip set. This is the standard Mega ST TOS version. Will work
in any ST model. Offers a few new features over TOS 1.0 such as keyboard
reset and blitter support, but does not have all the features of TOS 1.4.
$5

<< SOFTWARE >>
(Note: A * by the name indicates that I don't have the documentation.)
The list format is:
Title, Vendor, Price: Description

*MichTron BBS 1.8, MichTron, $3: Electronic bulitten board host software.
Financial Cookbook, Electronic Arts, $3: Financial planning.
HabaCom 1.06, Haba, $2: Telecommunications, terminal emulator.
*Flash 1.6, Antic, $3: Telecommunications, terminal emulator, nice.
*Kermit & Remote Control accessory for Flash, Antic, $2: Adds the Kermit
file transfer protocol and remote access capabilities to Flash.

Stephen Atty (satty@cix.compulink.co.uk) wrote:
: Some Hd drivers like the Protar ones allow you to select an alternative
: boot drive on startup. This means that once the system has booted off the
: floppy you have to tell the system to find the Hd (easy if you have TOS
: 2.06) and then rip out the offending acc.

: I found that the best way was to put the prog on a floppy and use that as
: the boot device for testing.

: I managed to do a similar thing when developing a Boot password program!!

: Steve

The case of the the ACC bombing your computer should easily be fixed by
holding down control when boooting the harddrive so that none of the auto
programs or accessories boot, and then either rename or delete the
offending file. In the case of the floppy not booting, hold down
alternate and it'll boot from the floppy instead of the Harddrive.

Hi all....

anyone got a set up for using a BJ10 with auto-paper feeder with NVDI 3. The driver suppled just doesn't work properly... page doesn't print from the correct top margin, sometimes get a "CJ" printed at the top of the page. The only way I can get the margins to correctly at all is to add a C/R at the end (or beginning! - can't remeber which) to the vert feed control codes using the printer driver programme, but this means that I now get blank pages between pages.

Any clues??

Regards,
Geoff

This isn't really a continuation of the thread, but I would like to ask
a few things cocerning "Chimera".
I've already downloaded it, but I have absolutely no idea at all how to set
it up. I understand that I need MiNT (and x11 as well?), but what files
at a minimum do I need to get it working?
I don't have a hard disk yet, and although I understand that there might
be some changing of disks, is it possible to set up and tun Chimera
on a set of disks on a 2MB TOs 2.06 STE machine?
Any info regarding this will be greatly appreciated!
Thanks.

Although I don't have my TT yet, (I will get it in and set up sometime next
week), I have tried it on my color MegaSTE with a mono emulator and it seems
to work ok. I agree that color support would be a big plus here.

Anyway, you should be able to set your TT to ST high and use it that way.
Look for some autoprog that will set your TT to that mode before MiNT runs.
Maybe someone on the net knows which program will do this, since I will be in
the same boat come next week!

BTW - I have heard that MintX in TT high is absolutely wonderful.

60. Supra Express 14.4 PLUS series fax/data modems

Newsgroup: comp.sys.atari.st
Date: 1995-04-03 00:00:00 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <D6GyyF.5nw@freenet.carleton.ca>
Source record: 168211

Recently, I posted a query about the Supra Express 14.4 PLUS fax/data
modems. I originally thought that they did not come with a
Power supply, but here is the asnwer that I got directly from Supra:

MM>The unit comes with a DB 25 connector. Will it run off An Atari Mega Ste's
MM>9 pin RS232 port using an adapter plug (25 to 9 pin?)? I'm not worried
MM>about the port being able to keep up, as the Mega Ste serial 1 port is
MM>rated for high-speed use. The older, Atari compatible port can only go to
MM>19,200 (Just Like Windows!).

MM>If the unit proves to be practical, I plan on letting all the Atari
MM>Usenetters know that they have a good quality, low cost alternative to USR!

Yes, the PC version of the SupraExpress 144 PLUS will work fine
on your Atari with a 25 to 9 pin adapter. It does have an external
power supply.

Sorry, not enough data available yet, but MiNA will very likely come with
all WinX features and be fully multitasking aware. Martin Osieka is busy
programming (I hope) and so I don't want to interrupt him doing so.

There's some discussion on MiNA in maus.gui.gem, but I am not quite
interested in translating.

>and we can still run French 220v appliances on our mains.

I know that its not directly related but in the UK the voltage is now 230V
+10% -6% which means we can go upto 253volts and down to 217volts whereas
in France to voltage is 230 +6% -10% (243 and 203volts respectively). So
we can both share a common voltage but do not have to change anything.

Ah the wonders of European law!

Steve (whose voltage has stayed at 242 volts for the past 18 months)

I would persist with CoMa. It works very well when you get it set up
but it will only send the first 500 scan lines in a message so if you
put a large space at the top of you text that might be the only thing
that came out. Failing that I had the same problem when I had the
wrong paths selected. When you pay you will get a non crippleware
version which sends and recieves with no probs and if you have it set
up as an ACC can be used to send from a wordprocessor or whatever and
will automatically detect and recieve faxes when you are in another
programme. I have registered and I am pleased. Hope you get on all
right. CoMa is cheaper than STFax BTW. Some people are having some
success with Junior Office which is not crippleware but only has
German docs. There are English docs in CoMa 1.27

I have sold my Mega ST and have removed the PC Ditto II that had been installed and successfully used for years. Has been used with DOS 5.0 and WordPerfect 5.1 for DOS so is very compatible and particularly useful for those who need to bring their work home from the office where PC's are used. I also have a mint condition IB Drive (5 1/4 inch) also that connects to drive 2 port. IB Drive includes original box. If you would like to add cheap PC emulation to your ST [needs to be 64 pin, rectangular 68000], please e-mail with your offer.

:
If you are seriously talking about floppy disks, then I suggest that you bin them. This is the physical equivalent of dragging them to the Trashcan. Eventually your trash collectors will come along and remove them, and your problems. Then you can go and buy some shiny new ones.

Floppies do not last for ever. Eventually the magnetic coating gets worn, distorted, falls off and a hundred other things,but it all means that it doesn't work. Once this happens there is no cure. Throw them away and get some new ones, They're cheap enough for god's sake.

: familiar with ATARI ST computers, so please forgive my ignorence. THANKS!!!!
:
:

I use NOS from Demon Internet. It's ported over from the PC, but it works,
sort of, most of the time. Well, the main bit does, it's the odds and sods
with the bugs.
get it from ftp.demon.co.uk in /pub/atari as STS110.zip (I think) you'll
also find nos042.zip which is the current version of the core code.
sts110s.zip will be the source if it's there (I haven't looked lately)
The Demon archives contain loads of material, sources and docs, on Internet
access software; look around in the atari and pc archives for NOS, KA9Q,
STMH, etc. Look in the /docs directories for the relevant info on the
sources etc.

AFAIK there is no stand alone web browser YET. Several are being written,
and there is apparently one that runs under MagiC, MinT and the rest of
that shebang. Ask a mintoe for info on that - I have enought trouble woth
what I've got :-)

>
> Please - this 12" monochrome is killing me!!!!!!!!!
> Help!

Well, I'm using a Moniterm Viking too, but then again I have a TT... Too bad, the Falcon can not create the high frequencies which this monitor needs (71 Hz vertical refresh and about 70 kHz line frequency) The dot clock frequency is more than 100 MHz (!) and finally the video signal has to be ECL level (two wires a '+' and a '-')

But I suggest you try selling this monitor to a TT user (Linux and X-Windows is great on this tube !!) and buy a good VGA monitor (15" or better 17"). With Blowup you can do high resolution and have color too.

BF>Could a power supply from an AT be used as a replacement for the Atari
BF>brick?

Yes.

BF>All the voltages seem to be there, i.e. +5, +12 -12.

-12V isn't required, it's generated on the mainboard using a TL497.

BF>I noticed that the Atari has two 5v pins on the power supply. Does
BF>this mean that these need to be two separate, i.e. isolated 5v outputs

No, you only need 3 wires of the PC power supply.

BF>I would like to hear from anyone who has done this

My STE is located in a PC tower housing and powered by a 300W PC power
supply.

BF>and if there are any problems or pitfalls.

No.

100. Speed of Light 3.7 RELEASE B

Newsgroup: comp.sys.atari.st
Date: 1995-04-03 00:00:00 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <D6G76L.FEJ@beaver.cs.washington.edu>
Source record: 168324
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

That's right folks! There is yet another release of SOL 3.7, release B.

This fixes another serious bug that prevents a select few registered users from registering with their old keycodes. Release B works fine with these, but older versions would reject a very few of the keycodes accidentally.

So, you can get release B from my WWW Home page:

http://www.cs.washington.edu/homes/sdenman/

or from some ftp sites, but it probably won't be out yet. I'll post a small list later on.

If I could have everyone's help to replace all those old versions with this new release B, that would be great! Somebody could upload it to a bunch of ftp sites, and Genie, Compuserve, CIX, etc.

Please also Email me if you would like a uuencoded copy mailed to you.

Sorry about all these bugs, I'm just glad I can fix them so quickly.

-Stuart Denman

> No argument here, since I use it with a Sportster :>

So I guess that what SS meant was that it does not support class 2.0 yet.
It's only since the recent post that someone made that I have understood
the differences between the classes.

Does anyone know in practice how much difference it makes what class is
being used, as long as the software works?

Coma supports class 2 and 2.0 (though I'm still having problems getting
it to work with the Sportster) but not 1, and I think Junior Office
supports 1 (and maybe 2, but not 2.0).

Sure, why not.
So:
In .ttp parameters line you write:

e drive_letter:\<folder(s)\>your_zoo_file

<> means optional. (Don't write it!)

Path should be in capitals.

OR:

Use dcsea.prg - it will make a self-extracting file from your zoo, arc, lzh
or zip file. It is great. (It is somewhere on The Net, but I don't remember
where.... ;-)).

That's all.

>so how do I set up to boot MiNT in mono and get this thing running.
>
> Russ

Hello,

First of all, I do not have a TT so the things I am going to say about
booting in Mono are just (calculated) guesses.
About X: Make sure you start up X *and* the X apllications. This is done
automaticly for you by startx or xinit (if you use xinit you have to use
the default paths or supply them via the command line). These programs
start X and the window manager including an xterm and an xclock.
I recommend using the xvt and the fvwm manager form phlem.ph.kcl.ac.uk
(save lots of memory).
I always thought that the TT mono resolution required a special monitor
(the 1280x1024 resolution). SO i do not know if it is possible.

Good Luck

108. Re: ACC bombs my mste

Newsgroup: comp.sys.atari.st
Date: 1995-04-03 00:00:00 UTC
From: fezzy@perth.DIALix.oz.au
Message-ID: <3loj4i$80t$1@perth.DIALix.oz.au>
Source record: 168332

Paul Hills (hillsp@genrad.co.uk) wrote:
: In article <3kkrv7$hs4@gbc.gbrownc.on.ca>, (Darren King) writes:

:]I put a program (acc) that I had written and thought was free of bugs
:]in the root directory of C: drive on my Mega STe. I then found out
:]on re-boot that there were bugs (or bug!) in it because every time I
:]boot, my machine bombs with 2 bombs. I would remove the offending
:]program but it won't boot for me. Also for some strange reason, my
:]machine (TOS 2.05) won't boot from the floppy but I have known this
:]for years.
:]
:]Any help would help...

: I had a similar problem with my Falcon. In the end I did this:
: 1. turn off the computer
: 2. Disconnect the hard drive ribbon cable
: 3. Turn on the computer and let it boot, either from ROM or floppy.
: 4. Now the dodgy bit... Reconnect the hard drive ribbon cable.
: 5. Run whichever hard drive driver software you are using from the floppy it
: came on (In my case, I ran AHDI or HDX on the disc which came with the
: Falcon), and tell it about the hard drive again.
: 6. When the drive C icon appears, go into it and remove the offending
: .ACC from the AUTO folder.

: Normally I wouldn't recommend connect up a hard drive with the power
: on, but in this case you haven't got much choice it seems. It didn't
: damage my machine at all, but I'm not saying it won't!
: Good luck.
: Paul Hills

The above method is **VERY** dangerous to both the drive & the MSTE....

If all fails 'read the manual' !!!!! All that is needed to bypass the hard
drive is; after you have switched on your machine, hold down the ALTERNATE
key AFTER the floppy light comes on for the first time and hold it down until
your machine starts to boot from drive 'A'...

Then run the driver software... as per steps in items 5 & 6 above....

Good luck

>needless to say (I live in the US.) I can't use any of it. Could someone
>tell me where I can get a replacement power supply for both of these, or
>if it's not to be had. would someone like to buy it?

A lot of equipment uses a universal PSU which is configured for
the various worldwide power line standards. Your monitor may well have a
small coin-type switch for different mains voltages, which can be flicked
over with a screw-driver.
As for the ST itself, have you opened it up and looked at the power
supply. I don't know what it looks like, but it may well be easily convert-
able, either by a switch or wire links. Maybe someone else with a 110v
ST2 can post a description of the links on the PSU so this user can check
his?
As for the disk drive, 115v will work fine on your 110v mains
(assuming that's your mains voltage). Here in the UK, our standard used
to be 240v +/- 10%, but is now the European standard of 230v which is
encompassed in the range we used to have. Therefore nothing had to change
and we can still run French 220v appliances on our mains.

Hope this helps a little. US 110v ST2 owners please help this guy!

Source record: 168342

In article <D69xuJ.A9x@cherokee.nsuok.edu>, foltin@cherokee.nsuok.edu (Bela Foltin) writes:

] Could a power supply from an AT be used as a replacement for the
] Atari brick? All the voltages seem to be there, i.e. +5, +12 -12.

Only if you have your Atari in a large case like the Desktopper.
PC power supplies are big. Refer to my previous posting about this a
week ago.

] I noticed that the Atari has two 5v pins on the power supply.
] Does this mean that these need to be two separate, i.e. isolated
] 5v outputs, one of them could be taken from another output plug
] of the AT power supply?

I assume one of these is for the IC's and the other for something
that pulls more current, or does so in nasty bursts which would otherwise
cause drops on the IC's 5v line. Therfore, they should be kept separate
from the PSU to the board. I very much doubt if they are isolated from
each other, so don't worry about that, they will be isolated on the board,
but not in the PSU. As far as I can remember, the PC power supply has
plenty of feeds from it, so use a separate 5v wire for each of the two
feeds to the board.

Message-ID: <3lom1l$61@btmpjg.god.bel.alcatel.be>
Source record: 168343

Hi, Atarists,

Does anybody know if a MIDI-player exists for a ST/E, similar to the Windows' one. I've never seen it. I would like to sort loads of midifiles without loading them one by one in a sequencer...

Do you know if this exists and where I can find it ?

Andre

Source record: 168344

Commodore 1084s monitor - Hooks to about anything. Works great; no screen burn-in whatsoever. This FABULOUS display is the best possible for hooking to the Atari 8-bit computer - with "split" composite (sep. chroma/luminance inputs), as well as regular composite (VCR), digital RGB, analog RGB (ST, Amiga, Jaguar). Includes cables for (1) 8-bit Atari, (2) Atari ST, (3) Amiga. You can hook it to an ST/Amiga *and* 8-bit Atari (or VCR) and switch between sources with a slider on the front! Asking $100 - a bargain with all the cables.

Also: forgot to list a couple of books in my long post: (soon to revise and incorporate, however)

The 68000: Principles and Programming - $2

Compute's 1st Book of Atari ST - $5

Don't like the price? Want to make an offer? Want a package deal? ***I'M ALL EARS*** Send me email. buyer to pay shipping.

Hello. I bought a 1040STf a while ago and can't find much of a use
for it yet except word processing. I'd like some suggestions of quality
shareware available on the Internet for it. I would really like the
following:

Terminal Program
Audio Program (Midi and/or my stereo system)
C or BASIC compiler
Desktop Enhancement (other than NeoDesk, that costs money)
A good high-res mono emulator (I have a SC1224 monitor)
Info on HD pinouts

Any help is greatly appreciated. Thanks!
E-mail me or leave a message here. Whatever.

> CYBERAARON@AOL.COM

I used to own an 110V MSTE4 (I have just 'sold' it). The power input label
at the bottom of the computer stated 115-220V which means that it is an auto
transformer in the unit. I am not sure of your MST but if the label states
115-220V then you should be able to use it in the US. Try calling Atari and
ask them (or open up your MST and check the transform).

Source record: 168252
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.next

SFAIK the 56k has only one _external_ memory bus, and hence can only fetch one external word at a time. p554mve@mpirbn.mpifr-bonn.mpg.de (Michael Elst) explained it to me like this:

\begin{quotation}
In comp.dsp you write:
>(all addresses off the top of my head, on-chip ROM/RAM omitted for
>simplicity). My question is: does this imply that the DSP will only
>be able to reference one of X, Y and P per instruction cycle?

No. Independent of address mapping you will find that external memory can only be accessed serially (there's just one bus anyway). If an instruction accesses several memory spaces then _one_ access can happen on the external bus without any penalty, multiple external accesses will need extra cycles (and there's a fixed priority in which pending accesses are finished, I think that's X and then Y and then P).
\end{quotation}

134. Problems with MagiCMac and Comms

Newsgroup: comp.sys.atari.st
Date: 1995-04-04 00:00:00 UTC
From: djs@jet.uk
Message-ID: <djs.796990185@gen-off-2>
Source record: 168257

I'm having big problems getting my Mac (running MagiCMac) to talk to my
modem. I have installed MACM1.PRG, DRVIN.PRG and SCC.PRG into the
AUTO folder. DRVIN runs OK, MACM1 runs OK, but SCC.PRG causes an exception.

If I run MACM1 before DRVIN it gives an error (something like "MAPT_OVE error")

Any ideas out there?

Try changing your auto programs and your accessories. Or it may
even be because you have certain CPX's loaded. I ran into the problem
again, but I haven't bothered trying to find the problem because I have
the Speed Switcher program in my auto folder (it seems to work really
well, and you just press control+alternate and either + for 16mhz w/cache
or - for 8 mhz without cache. You can get it at nic.switch.ch in the
Ste folder.

You could stop using the fileselector or start using Linux.
There are fileselectors that work in mono (like selectric).
Linux works in 768x480 16/256 colour modes (at least with my machine!)
and X windows run in both these modes.
(well I have some memory problems, but I am using a swap partition.)
I have to find xvt and chimera for Linux and I'll be the happiest man on
greece...

137. [HELP] Hardsdisk problems

Newsgroup: comp.sys.atari.st
Date: 1995-04-04 00:00:00 UTC
From: eems@nlr.nl
Message-ID: <3lqsqj$a46@liberator.et.tudelft.nl>
Source record: 168260

Hi,

I have a real problem with my atari Falcon 030 (4mb , 80MB IDE, 240 SCSI-2).
Recentley my G:-partition (60MB on SCSI-2) ran full. I copied a file bigger
then the space left on the G:-partition on it. The next thing I know is that
my H:-partition (60MB on SCSI-2) is not accesible anymore. THE FILE WAS
WRITTING OVER THE FAT'S OF THE H:-PARTITION?. All of my data on H: is lost.
No utility is capable of reading my H:-Partition anymore! All that was left to
do was backup the rest of my SCSI-2 drive and reformat and repartition it.
Yesterday I tryed MinixFS on my (clean) I:-paritition (60MB on SCSI-2) and it
failed (don't know why yet, no time to seek answer). I then copied a file
to my G:-partition and AGAIN my h:-partition is no longer accessible !
I got realy frustrated and started to backup the rest of my SCSI-2 (120MB left)
to my internal 80MB IDE. I didn't look at the space left on my D:-partition
(+/- 30MB on IDE). I wrote a file there that was greater than the space left
(I think) , result : E:-partition (+/- 30 MB IDE) not accessible anymore !!

WHAT is doing this. I use a Falcon 030, 80MB IDE , 240MB SCSI-2, tos 4.04
AHDI 6.01. It happend the first time running Multitos and the second time
with only blowup and NVDI 2.5 active (no multitos or plain MiNT).

143. QUES: Where to find CD rec

Newsgroup: comp.sys.atari.st
Date: 1995-04-04 00:00:00 UTC
From: gbar@mcs.com
Message-ID: <gbar-0404952023400001@gbar.pr.mcs.net>
Source record: 168266

I saw, in the latest AEO, a reference to a program making the BBS rounds called CD REC - it records from a music CD digitally. Anyone suggest a place on the net where I can grab a copy?

Thanks and have fun! - Bob

Re: ST mouse problem...

The The problemb is that there is a dry joint in the mouse somewhere, best to simply replace the mouse... The same happened to mine once.

With skill and a soldering iron you might be able to fix it, but it is a lot of work trying to find out where the problem is and the chances are it wont work anyway.

Good luck

Tim

146. Free FAX s/w

Newsgroup: comp.sys.atari.st

Isn't there a program called pbmtog3, and g3topbm which is available from GNU?
It will generate Group 3 fax code which you can then send to any modem, not just a
fax modem. It will also convert the data coming into the modem from a fax
to a graphic image. I would try it but I don't have a modem.

Has anyone tried using this program for making some freeware ST fax software?
I fancy having a go when I can get a cheap modem (pref. 14400bps).

Message-ID: <macdonald.211.0008FFF9@cfcsc.dnd.ca>
Source record: 168270

Just to correct some misinformation on my part. In a previous post I'd
mentioned that the setting for the *.acc's in the paramteres dialog did not
work. I expected this setting to allow *.acc's to be loaded from the c:\accs
folder without the use of , for example, acc.prg in the auto folder. I was
mistaken. *.acc's will not be loaded from the c:\accs folder without acc.prg.
Geneva however will load *.acc's from the c:\accs folder if that is the
setting in the gem.cnf file.
this from Dan Wilga at ACE'95
is this yet another case of RTFM?!

Message-ID: <macdonald.213.0009F3A8@cfcsc.dnd.ca>
Source record: 168271

I've looked here for info on NVDI, but haven't seen anything yet that deals with my problem.
I purchased NVDI 3.02 at ACE'95, and installed it last night on my 4 meg 1040STe.Seems to work fine in general, but there are two difficulties I've encountered maybe someone could help me with.
1). when I go to nprnconf.cpx My drivers for SLM804, and EpsonColourStylus are there, but the configuration panels under general(dpi, letter/legal size, orientation, etc) and under options are grayed out and I cannot change them. My SLM804 apparently has a 600dpi rating! I have tried deleting all the files installed, which is difficult as I do not know exactly what files were installed, and re-installing, with no luck. Has anybody had a similar problem?
2). This is a minor thing, but indicative- Running GemBench4.02, it hangs on the GDOS font test.
If I had my manual here I would e-mail the 2B's directly, I will probably do so some time this week, but I wondered if anyone had experienced similar difficulties
Thanks/merci

: Recentley my G:-partition (60MB on SCSI-2) ran full. I copied a file bigger
: then the space left on the G:-partition on it. The next thing I know is that
: my H:-partition (60MB on SCSI-2) is not accesible anymore. THE FILE WAS
: WRITTING OVER THE FAT'S OF THE H:-PARTITION?. All of my data on H: is lost.

That certainly is a problem... The one to blame is AHDI 6.01. It's a shame there hasn't been enough information available of this nasty bug. If I understood this correctly, the only AHDI-version that works correctly on Falcon, without writing over partition borders, is 6.061. Or let's say: that version works correctly - no matter what the previous versions do. Since it's free (sorry, I haven't got it here now so I can't send it to you), and available on many FTP sites, I think you should get it as soon as possible.

The hard disk drivers seem to be a bit strange things to handle. It isn't uncommon to find out that one driver works perfectly with SCSI-drives, and with some IDE-drives, but not all.. Or something like that. HDDRIVER seems to be as reliable as AHDI 6.061, and has some extra features with it. It is a commercial driver, sold with Outside 3 virtual memory program, and I think, alone too.

Good luck!

Tommi

>Basically, I'd just like to know what the address is, or how to set it, or
>whatever.

To change the screen use:-

```
void Setscreen(void *log, void *phys, int mode);
```

Your bindings may be different (long instead of void) so look it up in
your Sozobon docs.

log is the logical screen, where all drawing actually occurs.
phys is the physical screen, what actually appears on the screen.
mode specifies the screen rez (you can find it by using Getrez).

If log and phys are the same, drawing is done on screen.

If you put -1 for log, phys or mode their original values are unchanged.

From experience on a Falcon, when changing the values it is necessary to
use Setscreen(-1,-1,-1) _afterwards_ to get it to work.

BTW, if you are using a Falcon it is a little more complex.

Also,

```
void *Physbase(void);
```

This returns a pointer to the base of the physical screen.

```
void *Logbase(void);
```

This returns a pointer to the base of the logical screen.

Hope this helps.

Phil.

156. Stoop 1.04

Newsgroup: comp.sys.atari.st
Date: 1995-04-04 00:00:00 UTC
From: phodgkins@cix.compulink.co.uk
Message-ID: <D6Ix91.H80@cix.compulink.co.uk>
Source record: 168279

To all Falcon owners,

I have released the latest version of Stoop, this is a shareware Falcon boot manager which runs on S/VGA and RGB monitors. While many features have been crippled, the unregistered version is very useable - it can do most things you'll want from a boot manager.

If you are already a registered user, you can send me a disk with padded envelope plus stamp (if inside the UK - otherwise I'll pay postage especially if the disk contains some new PD).

Since, Stoop is now keyware I can just send you a key, if you can get a copy from elsewhere.

New in version 1.04

Stoop can :

- Be booted in any resolution on a RGB or VGA monitor.

- Display folders instead of files in a board, this is primarily for moving folders of fonts in and out of NVDI 3's font directories, which means that you can choose which fonts to use at boot up.

- Protect your system with a password.

- Now wait for a set period and then, if not used, it will set up a default configuration and exit.

- Swap preset buttons around.

- Show an unlimited number of files and folders in the fileselector in a single directory, it is now only limited by available memory.

- Merge and remove file names with/from preset configurations.

- Change the speaker volume and balance.

- Turn off the keyclick and the system bell sounds.

- Change the colours used by Stoop.

- Select an auto-booting program for a one-off configuration more easily.

Phil.

You have to change your NVRAM settings using a suitable program, I think
there's one called BOOTCONF somewhere . . . Set to two colours - it kicks
in before running auto programs - well, it's already there.
Your screen will then extend magically to its proper form :)
Regards,
Ian.

There are No monitors that I know of that will scan at the SVGA
frequencies used for IBMs and still work at ATARi LOW res frequency. The
old NEC 3D was a good choice if you want atari low res, Hi res and VGA only,
or nearly all the later multisyncs can be used at SVGA and ATARI Hi Res
Mono, but will not give Atari low res color. Either way you will need a
cable adapter.

171. ST stuff for sale (package)

Newsgroup: comp.sys.atari.st
Date: 1995-04-04 00:00:00 UTC
From: BRYEDEWAARD@news.delphi.com
Message-ID: <3lstqi$q9r@news2.delphi.com>
Source record: 168294

I am selling the following as a package:

2 QuikNet Localtalk to Phone cord adapters (hook up MSTE/TT/F030)
Magic Sac + with book & disks & apple ROMS
Introducing Atari ST Machine code book & disk
Space Ace disks & manual
Turbo ST 1.84 & manual
Defender of the Crown disks & manual
Road Raider disks & manual
Tass Times in Tonetown disk, box & manual
Atari ST Assembly Language Workshop book & manual
Airball disk, box & manual
Devpac ST 2 disk & manual
Laser C disks & book
Programmer's Guide to GEM book
Music Construction Set manual, disk & box/sleeve
GFA BASIC 3.0 disk, box & book
Wercs disk
NewDesk Icon CPX disk
King's Quest disks
Revolver disk
Spectre 128 cart (no ROMS) & disk
Font Factory Pub Partner disk
Publishing Partner disk (mono)
Laser DB disk
HippoBackgammon disk
Dead ST mouse (cord damaged)

All for $25 + shipping. I cannot guarantee all the software as I have no ST
to test it on. This package is as is.

I also have a bunch of original ST manuals and language disks & such if
you want them with the above stuff.

-Bry

172. Re: How does MagiCMac work on the Mac?

Newsgroup: comp.sys.atari.st

In comp.sys.atari.st you write:

>has anyone tried out the operating system "MagiCMac" that runs ST software
>on the Apple Macintosh series computers?
>How does it work/compatibility/pros/cons/comments...

I have tested in on Performa 475 (25Mhz, 68040) with 12 MB - that's
one of the smaller Macs today...

It's about 5 times faster on that machine than on my Falcon - although it
works there with 256 colours and multitasking, while my Falcon has
normally 16 colors and just TOS.

The speed is almost incredible: Imagine Speedo vektorfonts just popping
on the screen, Pure C compiling so fast you can't even read the
compiling messages...

I have tested it with various programs. So far most work (sometimes
small redraw problems or minor color problems that should be
solved already in the newer version). What did not work was Calamus 1.09
and a program (written in out group at the university) that does not
even work on a TT or Falcon...

There are probably some unsolved problems like printing in an easy way and
also sound is not working in that version. Also it's not completely MTOS
compatible. But these are things that should work in the future.

MidiCom already works, so you can even connect the Apple via it's
serial interface to any ST or even the faster TT/Falcon ports to
use their drives. Very nice...

Re: looking for good Shareware for the ST...

If you can locate an Atari users' group near you, they'd probably be the best source of programs and opinions. Most users groups have a club software library of non-commercial programs available for a nominal fee to members.

Incidentally, if the objection to NeoDesk as a replacement desktop is that it costs money, you don't want to look for Shareware, as IT costs money too..

At least, it's supposed to...

> How do I make pc-formatted disks with my Atari ST?
> With some little program?

Most PD/Shareware formatters will do this, but my personal favorite is a program called ps2form.tos on atari.archive.umich.edu. It formats disks that will work even on old PS/2 and NEC PCs (which were extremely picky, and often didn't work with floppies formatted on other PC clones). I have been using it for years with no problems.

Pretty weird. I use the utilities written by Atari (or at least, an Atari employee) to set speed by hand. Also, you can create a boot sector for your boot floppy disk (of course you have one, to speed hard drive boots, right?) that will set 16mHz, thus making your bootup time as short as possible. Check out the Ste/Mega directory on atari.archive.umich.edu for these goodies (bootsie might be in /Disk). I cannot remember ever looking at the speed indicator in the control panel, so I can't help you there.

> Also, is there any utility which provides a visual indication in

> have that since I'm never sure what speed it's running at.

I have not seen one. Basically, I leave it set to 16mHz w/cache for everything except games. To get games to come up at 16mHz, you can try a 16mHz booter utility (in the above mentioned directory).

This is a problem with one of the three Atari mouse designs. The other
two don't seem to have this problem. The best of the Atari mice (IMHO) are
the Japanese ones with the large nylon sleeves on the rollers and the
circular "ball door". Yours probably has thin metal rollers and a sliding
door. I think the problem is related to the cable, so you might try
remelting the solder from the cable on the board. Good luck!

Toad Computers has a nice selection of mice, including the super cool (looking,
at least) cordless/charging-stand mouse. I recommend that you stay away
from Beetle mice, as they seem to break very easily (both of the ones I have
seen died after only a few weeks of use). I have read that Amiga mice can
be converted for Atari use by switching two wire-plugs inside the case, no
cutting or soldering necessary.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

OK, I have (fairly successfully) installed MiNTOS 1.4, and am using tcsh 6.03 pl3 and the GNU file utilities. I have the file utilities installed in a directory in my /usr/bin directory for ease of maintenance. The problem is, I can't figure out where the PATH environment variable is set. I can set it easily enough from the tcsh command line, but I'd like it to be set automatically to include /usr/bin/fileutils-3.9. I've looked all over the place, in all the csh.* files and rc.* files, and there's no indication of where the PATH (or any of the other variables) are set. I don't thing mint.cnf does the trick either.

Note that I'm logging in as root, and my home directory is completely empty.

182. WWW browser (maybe I'll write one)

Newsgroup: comp.sys.atari.st
Date: 1995-04-05 00:00:00 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <D6KwDK.EwB@watserv3.uwaterloo.ca>
Source record: 168107
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello all,

With all the fuss about WEB browsers, etc. I think I'll tackle the job of writing one (well, when I get more of my thesis finished). The thing is I don't want to rewrite all the networking stuff avaialable under MiNT/MintNet like SLIP,PPP interfaces and the approriate daemons and even the 'chat' program. This stuff already works (and very well I might add)

So what this amounts too is a WEB browser that only runs under some GEM system over Mint - ie MultiTOS (and Geneva as soon as Dan gets the Mint compatibility out there). I don't have Magic - does anyone know if Magic runs over Mint? I would like to write something accessible to all Atari users - is it reasonable to expect most Atari users have one of these OS's to use? GDOS would also be a requirement as there is again no need to re-invent the wheel. I think most Atari owners have access to GDOS and some fonts.

After showing people Chimera under Mint-X at TAF's ACE '95 show it is obvious to me that there is an incredible amount of interest for a WEB browser - most Atari owners I talked to had reasonable systems (ie 4meg of RAM and a decent hard disk). Most, howver, would rather not set up an X-windows system.

Let me know what you all think... when I have some time I will start developing a strategy for coding. I would like to write something that's relatively efficient so 8Mhz ST owners can enjoy browsing the WEB and 48Mhz TT owners (like myself) can show off how much faster our WEB browser is than those on other home platforms. (hey calamus wins hands down for DP speed compared to anything on any platform).

Sam

187. IOMEGA ZIP Drive Info..

Newsgroup: comp.sys.atari.st
Date: 1995-04-05 00:00:00 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <3lu27n$btm@golem.wcc.govt.nz>
Source record: 168112

Well here is the Info on the 100meg IOMEGA ZIP Drive,
you can also find more about this firm at HTTP://WWW.IOMEGA.COM

I found out about this firm from reading a Amiga News Group...

ZIP DRIVE PRODUCT INFORMATION

What is it?
The Zip Drive is Iomega's new removable disk drive.
For $199.99 the Zip Drive offers you additional storage for your PC or
Mac, and additional Zip Disks are available in 100MB -$19.95, and 25MB
-$9.95 capacities.

The Zip Drive is a SCSI II device that has two SCSI connectors,
switchable termination, and switchable SCSI ID address. The access
time on the drive is 29 milliseconds, and the sustained transfer rate
is up to 1.25MB a second. -However if you really want a good example
of the drives performances, run the Zip Tour demo that comes included
with the drive. This is a multimedia demo.

The Zip Drive is also available in a Parallel Port version for the PC.
This model lets you connect to any PC or PC LapTop instantly. The
drive also offers a printer pass-though feature so you can still use
your printer while the Zip is connected.

The GUEST software that is included lets you connect and access the
drive without the need to modify the system setup (ie config.sys).
GUEST is a special utility that runs from the command prompt and
assigns the Zip a drive letter. After you are finished and have
removed the drive, then you can reboot to remove the GUEST from
memory. A real "plug-and-play" device.

Additional useful information on Zip:

Technical specifications

Frequently Asked Question (FAQ)

Zip Accessories (the cool stuff!)

Zip Drive press release

ZIP Frequently Asked Questions (FAQ)

WHEN WILL THE ZIP DRIVE BE AVAILABLE?
The Zip drive is scheduled to start shipping in late March 1995.

WHAT IS THE PRICE FOR THE DRIVE?
The street price for the drive will be about $199.99. A 100MB starter disk is included with this price. Additional 100MB disks will have a street price of about $19.95 for each 100MB disk.

WHY IS IT CALLED ZIP?
The Zip name is descriptive of the products key attributes; speed, mobility, simplicity, and security.

IS COMPRESSION USED WITH IN THE ZIP DRIVE?
The Zip drive works similar to a normal hard drive. It does not automatically perform any data compression during write or read operations. However, popular compression software, such as Stacker, should be compatible. Also, backup software with compression works with the Zip drive.

IS AN INTERNAL ZIP DRIVE AVAILABLE?
The ZIP drive is an external drive only. There are two models, a SCSI model and a Parallel Port model. There is currently no internal model available but it is being considered by Iomega development.

WHAT ZIP DRIVE MODELS ARE AVAILABLE?
A Zip SCSI model and a Zip Parallel Port model. The SCSI model can be used with Macintosh or a PC that is using a ZIP compatible SCSI adapter. The SCSI model has two 25 pin SCSI ports (for chaining), a SCSI ID switch, and a SCSI termination switch. The Parallel Port model can only be used with a PC and connects to the computers Parallel Port.

DOES ZIP USE BERNOULLI TECHNOLOGY?
NO, Zip uses a new design which leverages Iomega's 15 years of experience with high capacity removable storage.

WHAT IS INCLUDED WITH THE ZIP DRIVE?
The Zip solution comes complete with drive, cable, power supply, operating software, and a starter 100MB disk with Zip tools software.

WHICH SCSI ADAPTERS CAN BE USED WITH THE SCSI ZIP MODEL?
Iomega provides a optional low cost SCSI adapter called the Zip Zoom Accelerator. Other ASPI compatible SCSI adapters can be used in conjunction with Iomega SCSI driver software.

WHAT OPERATING SYSTEMS ARE SUPPORTED?

DOS 4.x or greater, DR/NOVELL DOS 6.0 or greater, Compaq DOS 3.31 or greater, and Windows 3.1.

OS/2 version 2.0 or greater, with the purchase of the optional Iomega OS/2 driver software package (OAD For OS/2 version 2.33 or greater).

Macintosh System 6.0.7 or greater (System 7 is required for full functionality).

WHAT ARE THE SYSTEM REQUIREMENTS FOR MY COMPUTER?

IBM PC And Compatibles: DOS 4.x or greater, 640K RAM, Windows requires a minimum 2MB RAM (4 or greater is recommended).

Macintosh: System 6.0.7 or greater (System 7 is required for full functionality), 4MB of RAM, MAC SE or greater.

DOES THE PARALLEL PORT MODEL ALLOW PRINTER CONNECTION?
Yes, the Parallel Port ZIP model has a second port that lets you connect to your printer.

IS THERE A SPEED DIFFERENCE BETWEEN THE SCSI AND PARALLEL MODELS ON PC'S?
The SCSI model is 2-5 times faster, depending on your system configuration, however, the parallel port model is easily connected to any PC.

WILL THE ZIP DRIVE RUN IN BOTH HORIZONTAL AND VERTICAL POSITIONS?
Yes, the drive has rubber feet on it to support both horizontal and vertical positions.

IS THE ZIP DRIVE COMPATIBLE WITH REGULAR FLOPPY DISKETTES?
No, Zip disks have much greater capacity, performance, and durability.

ARE THE DISKS RUGGED?
The disk are very rugged. They can withstand a 1000Gs shock (an 8 foot drop) without any harm to your data.

HOW LONG IS THE DISK MEDIA SHELF LIFE?
Zip disks have a long 10 year shelf life.

ARE HIGHER CAPACITY ZIP DRIVES POSSIBLE?
Zip technology is capable of higher capacities in the future.

WILL THE ZIP DRIVE BE COMPATIBLE WITH POWERBOOK MACINTOSH?
Yes, a optional cable adapter is needed for attachment.

CAN THE ZIP DRIVE BE CHAINED WITH OTHER SCSI DEVICES?
Yes, The SCSI model can be put in a SCSI chain just like any SCSI device.

HOW IS POWER PROVIDED TO THE ZIP DRIVE?
It uses a AC power adapter.

HOW TO I GET THE ACCESSORIES FOR THE ZIP DRIVE?
Call Iomega at 1-800-MY-STUFF.

ZIP DRIVE TECHNICAL SPECIFICATIONS

Works like a hard drive...

Max Sustained transfer rate up to 1.4MB/second
Average Seek time 29 milliseconds
Buffer size 32K
SCSI throughput up to 60MB/minute
Parallel throughput up to 20MB/minute
Average start/stop time 3/3 second
Drive long format time (surface verify) 15 minutes
Drive short format time 5 seconds
Drive auto spin down Software selectable

No fail reliability...

Drive data bit transfer (hard errors) 10 errors in 10(13) bits
Disk drop height/shock tolerance 8ft/1000Gs
Disk estimated shelf life 10 years
Disk storage capacity 100MB or 25MBs;

The Zip drive read/writes 100MB or 25MB disks.

Operating system compatibility DOS, Windows, MAC, and OS/2
Drive temperature tolerances: Operating 50' to 90' F(10' to 32'C)
Storage -8' to 126' F (-22'to 52' C)
Shipping -40' to 140' F(-40' to 60' C)
Drive operational modes fixed or removable

Drive orientation horizontal or vertical
Drive service life 5 year
Warranty 1 year warranty on drive
Limited Lifetime warranty on disks

Dimension: Zip Drive Zip Disk
Height 1.5 in .25in
Width 5.35 in 4in
Length 7.26 in 4in
Weight 1.05 lbs .09 lbs

Interfaces Available SCSI or Parallel Port
Drive power requirements 5V, 1Amp continuous, 1.7 Amp peak

*All specifications are preliminary and depend on your system.

Can some one get the Image file and post it some place..

No, TOS programs have had environment variables all the way back to
TOS 1.0.

Desk Accessories are never given any environment variables by any
version of GEM.

Well you could use ST Tools2, which apparently has a hard disk defragmenter,
and is in the language of the Eng's. I've heard of Blitz(?) but I think that
is from the land of the men who are Ger. I myself use Oregon Softwares Diamond
Edge(just upgraded to ver. 2) and think it is pretty darn good, even if it
is by people who are perpetually in a State of Unitedness.(not puritans these)
later/plus tard
(from the land where people speak out of both sides of their mouths, ben oui!)

The version 2 of the minix fs should take care of the byte swap, or
at least it does in Minix. I don't know if either Linux or MinixFS
support V2 and/or the swapping stuff.

> Solution? Heck, I didn't even know there was such a BUG!
>

No? It's the only bug *I* know of (what are the others ?)

except for this one:

The first time I started my brand new german MSTE, I looked around for new
features and found a dialogue where I could choose screen resolotion.

```
--------------------------------

|ST-low| |Mittel| |Hoch|

|TT-hi| | VGA |

--------------------------------
```

I've forgotten the exact labelling but I think you get the idea.

Of course I was surprised, but why not try it out I thought?
I chose the VGA option hoping for a little less black bordering and...
Nothing happened.

This dialogue has never appeared again. I wonder what it was

I think very few people have actually had much experience with these new drives because they are so heavily backorderd, AFAIK. The specs certainly do look good, but remember the 21Mb flopticals looked good when they first came out too. ;-) Even so, I think the Zip units will be a big success if they can gear up production to meet demand. It might drive Syquest 270Mb prices down, too.

And yes... they are SCSI II devices.

In comp.sys.atari.st you write:

>Can anyone point me in the direction of a .WAV player for the Falcon
>which could be used by just installing it as an application for *.WAV?
>Should be able to handle 8-/16-bit mono/stereo without manual inter-
>vention.

You could use the program '525' to convert the wav-files to anything
you want (like avr or aiff). 525 is available from many ftp sites.

You could use the program 'fortune' to play many different sound files
like wav, au, avr, snd, dvsm, hsn. Fortune is also available at many
places (or from me, too).

Roger Sheppard.. (sheppard_r@kosmos.wcc.govt.nz) wrote:

: Atari has no Falcons in stock and is not making any more...

No wonder, since they sold their manufacturing plant to C-Lab (or so I understood it)... Still, they do have newer computer models in their R&D labs, more or less ready for production. They don't officially admit it - but people have actually seen those, so they are not just rumours. What Atari plans to do with them, is another thing. Right now they can't do anything, because Jaguar needs all the money there is, if not more.

: Also the German C-Labs Falcon is way way over priced
: at $3000US and has very little new features or fixed,
: in fact all of the features and mods can be fitted
: to a standard Falcon for far less money...

In the beginning, they certainly are over priced - just like the original Falcon was when it came to market. If demand is high, then the prices will drop, though. And what I've read about C-Lab Falcon II, it isn't a bad choice for musicians at all. They have fixed all the critical design flaws, and especially the 19" rack model should well interest very many musicians.

But for the "rest of us", I think there are two more interesting alternatives. One is MacMagic, of course. I have doubts about whether a Mac can ever replace e.g. a Falcon - the design of Macs (keyboards, mouse, strange disk drive, flickering 640x480 display, etc.) just doesn't make me happy at all. And too many programs seem to have problems with MacMagic, as well. Some people, besides, love MacOS - but I rather hate it. It's as stupid as a cow. Easy, but stupid.

The REAL alternative may well be the Eagle. A German TT-clone, twice as fast as a TT, and very easy to upgrade with 68040, or even 68060. Just yesterday I read (from German MausNet) some experiences from one Eagle owner there. He was extremely pleased. The thing has proved to be more stable than Falcon, and the support from GE-Soft (manufacturer) is good. As Eagle uses the same PC-standard graphics card system as Medusa, and (AFAIK) Falcon's Barracuda-040 accelerator, it's very easy and cheap to get Super-VGA resolutions and True Color 24-bit graphics to use. I think, this is the way to go; TT's ET-4000 graphics cards started this trend, and hopefully in near future all new Atari-compatible computers share the same high quality graphics capabilities.

What Atari needs, is some kind of standardization. It's easier to port e.g. PC CD-ROM games for Atari platform, when 1) Atari computers all have enough horsepower to handle complex games, and 2) they all use e.g.

ET-4000 compatible graphics which makes possible to use the PC-graphics directly. One problem Falcon faced, was the nice, but non-standard graphics engine. Many games developers said it wasn't easy to write games for Falcon, since the screen memory war ordered completely differently from PCs and most other computers. Falcon's graphics controller isn't very fast, either. ET-4000 W32 is.

: To the People that tell me to upgrade to a Falcon, Atari computers
: are not sold in this part of the world and have not been for 1-2 years..

: Even if you did import one, thier are no shops selling Software and if it
: breaks down it will have to end up in the rubish bin, Atari parts are not
: easy to get hold off and no one would fix it......

: For a way over priced machine that risk is far to high...

Those times are over, when people bought Atari as a "cheap" alternative to something else. Today, only those people buy Atari-compatible computers, who WANT to use GEM instead of Windoze or MacOS. People who are willing to pay more to get what they want. That's why I'm an Atari user still, too - despite the fact that in my home country, Finland, every computer dealer only cares about PCs and Macs. Well, we have large user groups who can help a lot. Always _somebody_ knows how to find the spare parts, or software dealers, or whatever is needed. I think, all the Atari users should form such groups - because after that, you really don't feel you're "alone in the big, frightening PC-world.." !

Cheers,

Tommi

I have to agree with you on the 21M Flopticals! Do you think that the
6.55 version of ICD Pro utilities will be able to handle the Zip drive,
or will we have to hand feed them the parameters of the drive. As you
say the Zip drive is kind of new! Maybe so new that the specs aren't
included in the Pro Utilities, since they came out before the drive
was available.

TwiLight is a commercial program and costs 70DM.

70DM for a screensaver?! People pay this kind of money just so they can
get pretty pictures flying around the screen while they're out of the
room?

Have a look at "Darklord" and "Before Dawn".

I would love to find such a beast too. Note the ICD utils allow you to
boot up in whatever rez you want. I only have TT hi but I have an
auto folder emulator for the other rezs. The reason I want to switch rezs
is because I am trying to make some Mint-X distribution disks and I
want to boot mint in ST-hi sometimes to test what I'm doing in that rez
as well (so as not to alienate all the non-TThi owners :-) An auto-folder
program that switches rezs would be lovely.

>
>BTW - I have heard that MintX in TT high is absolutely wonderful.

It certainly is! I can't live without it anymore. I've had moderate success
with linux but my files ALWAYS end up getting trashed with the ext2 file
system. And I sync the disks before I try anything dangerous! I think
I'll go back to the minix filesystem and try linux again. For now,
Mint-X is FAR more stable than linux (in my experience).

Several people seem to have CoMa working with the Sportster, but none of the suggestions they have given make a difference.

I connect without problem, and CoMa appears to send the message, but after that it times out, rather than giving a connection time. I seem to be able to send messages to some machines but not to others.

I am using the latest demo version, 2.70. It's definitely at the end of the sending where trouble occurs, and I think it may be due to problems with the minimum scantime.

I have switched on the "protocol" mode, so I have a copy of the messages going between modem and computer, and I will probably send it to Siegfried to see if he can solve the problem.

I was led to understand that using AHDI 6.061 fixes the problem
with the partition writing over the next logical partition. I am
using 6.061, and I have had no problems (I have simply gotten out of
space errors when I have filled up partitions) Why not try HDDriver?

In a Message of <03-Apr-95> Steve Taylor writes:

ST> I think class 1 is generally considerably slower than classes 2 and 2.0

Eh! Slower?? The main difference is that on Class 1 the faxsoftware handle
the most thing under the faxsession. And in Class 2/2.0 the modem handles
the most thing so it's easier to write a program to Class 2/2.0.

I've got an AdSCSI+ host adapter in a seagate 65 MB harddrive that crashes about 5 times a day now. Even with only a few ICD support files on one of three partitions the FATs are always corrupted. Now I can 'fix ' them temporarily with CleanUp ST but the FAT will be corrupted again if I can get the ICDBOot driver to recognize all the partitions. Normally it won't and I'll have to reformat or repartition.

If

The system is a Mega4 ST with TOS 1.4. I'm stuck with using this lame terminal program with shitty ANSI emyulation so bad that I can't see half of what I'm writing. Please resoppond via email with any ideas you might have of remedying this situation.

get in touch with Best Electronics in California; word is he's
bought out an entire warehouse of Atari parts and has them in his
inventory (at the ACE show last weekend, I bought an unusual
"4160STe" badge to stick on my 4-meg STE) from him.. He's also got
some of his own "home-brewed" stuff (like beefier ST power
supplies). He's at 1-408-243-6950; 2021 the Alameda Suite 290, San
Jose, CA. 95126.

Better ask for his catalogue, too - it's supposed to be
expanding to 300 pages!

STraight Fax 2 has special modified Calamus printer drivers
(both for 1.09 and SL) that will save your document in .FAX format
for use with it. I bought it on the weekend at ACE '95 and have been
merrily using it to send faxes off. Trust me, it works!

Yes, no problems.

: I noticed that the Atari has two 5v pins on the power supply.
: Does this mean that these need to be two separate, i.e. isolated
: 5v outputs, one of them could be taken from another output plug
: of the AT power supply?
No, as far as i remembered, i measured 0 ohms between these two pins.

: I would like to hear from anyone who has done this and if there
: are any problems or pitfalls.
I did so.
I use a modified joystick, and imho this caused a short circuit [sounds
strange, perhaps it had another reason, i don't know...]
So my power supply exploded, a transistor is burnt :(((((
Then i used a pc-power supply, first i connected all different voltages,
but later i reduced this: only 5V is really needed, missing 12 results in a
lower sound from the monitor.
I'm having a 1040STF, no HD, using it as a terminal for my UNIX-machine.
Even RS232 works without 12V!

I can't help you there, but I do know that it is very easy to install a
switch that allows one to switch between internal or external drive A.
Basically, you cut and cross-connect two pins on the Yamaha sound chip.
You can install a small switch to allow you to select which order you want the
drives to appear, or just hardwire it. Full instructions are on
atari.archive.umich.edu, probably in /Misc. Let me know if you have trouble
finding them.

Well, 50 or more modules are included in the demo version of
Twilight. These modules are all full versions, only the ACC is
demo.
And the other modules are not free- or shareware. So it's impossible
for me to load them somewhere up. :-(They are not expensive....
Another point: a few of them are beta versions and I'm not able
to see which are beta versions and which not....

>it as soon as possible.

Not quite right. The one to blame isn't the AHDI driver, but GEMDOS. ANY Atari machine contains this "time bomb".
The "writes one cluster too far" bug is in all released GEMDOS versions ever since the first one from 1985 (and it DID happen, mainly while extracting large packed archive files), but it couldn't be nailed until Falcon users started sampling stuff onto their harddisks 'til they blew up. AHDI versions 6.06 and 6.061 (and most commercially available drivers) contain extra code to prevent the bug from occurring.

bye, Peter

Source record: 168150

Sounds like these ZIP drives require some form of driver software to work (somewhat akin to CD-ROM drivers etc.)

From the pictures I've seen in a Mac-Warehouse catalog, they look like quite tidy little units, looking pretty similar to a medium-sized external 3.5" 720K drive.

The doc doesn't say anything about being SCSI-2 (which would be pretty stupid, as reasonably non-standard devices such as this should probably make access available to the more prominent SCSI format).

Presumably, if it uses standard SCSI data transfer methods, then running it via something like an ICD host adaptor should work without too much messing around. Depends on the internals of the device, it could need specific instructions or something, but if it's a read-info type unit such as the average hard-drive, then it'd probably work with an ST, and the Falcon shouldn't have too much difficulty, just plug it into the SCSI port.

$200 for an effectively 100meg hard-drive with those spec's isn't too bad, especially with an extra 100meg cart' being only $15-$20.

It sounds like they're pretty recent devices, so it'll no doubt be a while before someone with a PC at work and ST/TT/Falcon at home manages to get one and try plugging it into their Atari. If SyQuests and Flopticals work, then I can't see why this shouldn't!

I got a copy of the new Atari World magazine this morning. First impressions are very good - like ST Review.

The 1st issue is 2.50UKPounds with three separate mags, Atari World, ST Source and Atari Pro. There's no cover disk, but it can be bought separately.

There's a good range of adverts, and a large amount of editorial compared to STF.

I'm gonna subscribe :-)

>

Hi , I own CubaseAudio for 4 Weeks now. As far as I remember the modifications are not expensive at all.
Only some resistors s.o. . But it is not so easy on the technical side. So if you have skilled technical personnel it should be no problem.

Greetings from Germany ,
Markus

PS: I'm fucking down now... your in HAWAII and I'm in Munich (rain) :-(.

> the parameters of the drive.

Hmmm... I have no idea. Sounds like a good question to pose to Tom Harker of ICD (icdinc@genie.geis.com). Tom just got back from the Toronto show so maybe he'll be able to answer this one. It looks like the Iomega Zip Drive is going to be a huge seller, though.

Hi Hutch,

Sorry I didn't get back to you earlier about this message. I've been as busy as a busy thing writing for the 2nd Issue of Atari World.

Many thanks for this pointer, I've e'mailed Greg asking for his help. It's for a possible future article in Atari World - where we very much want to push the positive, practical aspects of Atari home computing as much as possible.

regards, Graeme

> The doc doesn't say anything about being SCSI-2 (which would be pretty
> stupid, as reasonably non-standard devices such as this should probably
> make access available to the more prominent SCSI format).

Er... the Iomega Zip Drive FAQ file that Roger posted yesterday says:

"The Zip Drive is a SCSI II device that has two SCSI connectors [...]"

And besides, SCSI II is generally downward compatible with the 'original'
SCSI spec, is it not? At least I've never had any problem doing so.

100Mb is nice, but 200Mb would be _really_ cool. Heh, heh... some folks
are just never satisfied, eh? :)

BTW, that 'burple' colored case would go great with an Indigo 2. :)

Souped Up Atari ST System
Prefer to sell as a system but will consider selling separately

Atari 520STm $200
- 4MB RAM (Tech Specialties upgrade board)
- Switchable Dual TOS (1.0 & Rainbow) (rear mounted switch)
- ICD 16MHz 68000 Upgrade (rear mounted Switch 8/16)
- DS/DD 3.5" floppy
- mouse

Atari SF314 DS/DD 3.5" floppy $40
Atari SC1224 Color Monitor $180
Atari SM124 Monochrome Monitor $90
Monitor Master monitor switch $15
Toadfile 44! (w/4 cartridges) $300
- SyQuest 44MB SCSI removable media drive
- Under monitor low profile case 2 bays
- ICD Advantage Plus SCSI host adapter w/ built-in clock
- Four (4) 44MB cartridges

DigiSound Professional (Sound digitizing
hardware & Software) $50
ADC 1200 Baud External modem $20

=======
$895

Will sell entire system for ..... $700
(C.O.D. shipping charges not included.)
Original packages software and documentation
included.

If interested, send e-mail or call Jim (412) 359-1763
Leave voicemail if I'm not in and I will return your call.

Interesting.
Would you by an STe or MegaSTe with 1 meg RAM, and then pay the extra $200 for
the 4 megs?
I should try buying 4 meg ST/e's, then removing the ram and selling it to make
a profit :^)
I don't think you're trying to do that, but I think I've made my point.

It's comercial (~ DM 129 ~ $100). It's one of the best resource editors
in the Atari world and it comes with a Pure C library for dialogues which
can fly, use round radio buttons, checkboxes, popup menus and many other
things, including a 3D mode one every Atari with at least 16 colours.

There's a (German) demo version available -- I'll upload it on
ftp.cs.tu-berlin.de later this week.

I was at the WIZZTRONICS booth a lot during ACE'95, talking about the
Barracuda. Unfortunately they did not have one there operationally speaking,
and I was told that they are still working out some problems. Sorry - I wish I
could remember more but I was exhausted. The spec sound great don't they
though. It was mentionned that they were thinking of selling the 32MHz 68040
right on the board instead of having it as an add-on.
have fun!
fait fun!

It is commercial. Formerly developed by SHIFT (R. I. P.) and now supported by

TEAM Computer GmbH
Klettenberggi¿½rtel 5
D-50939 Kï¿½ln

Phone : 49-221-46677-4
Facsimile: 49-221-46677-5
e-mail : Harald_Paul@K2.maus.de

Dunno the price and dunno if there is an English version available, though.
Anyone?

BTW, a _great_ source of information re. developers, programmers, dealers
still envolved with the Atari, are the ATARI-INFO-PAGES (AIP). This list was
earlier done by A. Wilhelm. The latest releases are done by

Manfred Ssykor
Hï¿½ttenstraï¿½e 46
D-52068 Aachen

eMail: Manfred Ssykor @ AC3
msy@lafp.tng.oche.de

Some statistics from the AIP:

Release | Authors | Retailers | Programmes | BBS'ses
--------+---------+-----------+------------+----------
4 | 449 | 176 | 466 | 117
5 | 455 | 183 | 482 | 121
6 | 462 | 186 | 534 | 120

I mailed a copy of AIP-release 6 to Danny and Chris Ridd earlier this evening.
So it'll most probably pop-up at HENSA and CIX and elsewhere real soon now ...

I can mail out copies, too.

Bye.

In article <3lulmj$ei3@sphinx.Gsu.EDU>
gs01tph@panther.Gsu.EDU "Tommi Pekka Hietavuo" writes:

:
: But for the "rest of us", I think there are two more interesting
: alternatives. One is MacMagic, of course. I have doubts about whether a
: Mac can ever replace e.g. a Falcon - the design of Macs (keyboards,
: mouse, strange disk drive, flickering 640x480 display, etc.) just doesn't
: make me happy at all. And too many programs seem to have problems with
: MacMagic, as well. Some people, besides, love MacOS - but I rather hate
: it. It's as stupid as a cow. Easy, but stupid.
:
I wonder which Macs you've been looking at?
I've just succumbed and bought a Performa 630 with Apple 15" M/S monitor,
and the display, in ALL resolutions, is steadier than my STe in mono. Nary a
flicker.
Why did I buy it? Not a lot of option really. The ST is, as a commercial
computer, dead, and the Falcon is too expensive and too poorly supported to
be worthwhile. Support from Atari never existed, and despite enthusiastic
amateur support over the years, if the maker doesn't think it's worth
supporting, who wants the things? The recent flamewar in c.s.a.st put me off
the PC, there wasn't much left.
Price was a factor, too. A Falcon with reasonable memory and HDD would cost
around 1000ukp. Add a suitable monitor and we're getting near to 1300. Me
Mac has all that, plus CD-Rom built in, for under 1300. Massive worldwide
support amd software base, Atari capable with MagicMac, a plug-in 486
available, and upgradeable to PowerPC processing while still retaining full
software compatibility.
I just wish it had GEM too.

: The REAL alternative may well be the Eagle. A German TT-clone, twice as
: fast as a TT, and very easy to upgrade with 68040, or even 68060.

Where from? no sign of one in England that I know of. My Mac has a 68040
already.

:
: What Atari needs, is some kind of standardization. It's easier to port
No. What Atari needs is to learn how to make the computers that the market
wants, how to market them properly, how to provide PROPER backup. All the
things the Apple and PC people have done for years, even thought the design
concept was ten years behind the Atari in the case of the PC, and more
restricted in the case of the Mac. Continuing development would have helped
too. Look at the range og PCs and Macs over the years, then compare it to
the ST range.

Atari's problem has always been the afterwards. The initial concept has
been excellent from the old 400 onwards. The support and backup has been
crap.

I'm sorry they've effectively died; I just can't bring myself to be
surprised.

Some of the MausNet newsgroups are imported to Usenet. maus.gui.gem is
the newsgroup where Martin Osieka posts the latest developments of MiNA.
I actually translated Martin's first announcement of MiNA and I posted it
on the gem-list. Strangely, no one seemed to be interested in this so I
didn't care anymore. But I'll see whether I can find the translated article
again and post it in here.

: It's called MMACDEMO.SEA and is about 467k. Be ready to read German!

You can also get it from HENSA (micros.hensa.ac.uk), in:

micros/atari/tos/p/p144/

File name:
MMACDEMO.SEA.hqx

Size:
860360

The file is a binhexed, SEA file. Reason for hqx is so that you can
download onto any platform, and place it on a disk and take it to the
Mac...you do not need a Mac to download it, unlike the SEA one which
will need to be downloaded onto a Mac to work (well, unless you are
very good at operating mac files, and filetypes)

>in fact all of the features and mods can be fitted
>to a standard Falcon for far less money...

Well I heard this was the case some time ago however I've heard a rumour that C-Lab wasn't allowed to competively price their Falcon and create Falcons with less the 16Meg (14 accessible). This was because they would be in direct competetion with Atari which was ceasing production and selling the remaining stocks.

Once Atari is no longer producing them C-Lab will be allowed to reduce their prices and create other configurations (4 Mb, without hard disk, etc..). If I get more news or C-Lab make some changes we will see if it was true.

What are used TT's going for these days? I know Wizztronics had a 2/50 floor model w/ TTM194 going for $800 US at ACE'95. Was this an extraordinarily good bargain, or are TT's this cheap everywhere? I checked the Computer Direct catalog, and they're selling their DirecTT for arounf $1500 Canadian with 2 megs, no HD, an no monitor, but in a PC tower case, with a DEKA interfaced PC keyboard, and with the CaTTamaran installed. This price is a little more that I fell like spending...Wizztronic's price was more like it.

SMS2 is a versatile O/S that plugs into to catridge port. The high speed multi-threaded O/S is probably one of the fastest windowing system I have ever seen. Rather than being a new O/S for the ST it is best to look on it as a new platform for the Sinclair QL which allows QL users to run their existing applications faster and allows full utilization of the QL multi-tasking front end. It is, in effect, the QL version of MagicMac

No, it's not a QL replacement. SMS2 is an OS independent from the QL. SMS2 has at no time be offered to existing QL users. For QL people there exists SMSQ, which is 100% QL compatible. (The only difference I know of, is that for SMSQ you have to write an startup file and you have a QL compatible BASIC, in SMS2 yopu have no BASIC and you need no startup file, as usual on Atari.)

Hello,

Here's the information on MiNA which I had translated and posted
on the gem-list.

##*#*#*
If you want to contact Martin directly write to:-
Martin_Osieka@of2.maus.de
Please, make sure not to send him mail >16KBytes (MausNet limit).

Andre

---translation on---

From: Martin Osieka @ OF2
Date: Sun, 05 Feb 1995, 23:35
Subject: MiNA pre-information

Since I'm quite tired of the monster patch WINX on the one hand, and
since I can't work on the MultiTOS-AES and MagiC-AES respectively
for several reasons on the other hand, I have decided to begin with
MiNA.

Similar to MiNT, MiNA will be an AES with freely available
source code. Highest compatibility of the AES interface with the
MultiTOS-AES is aimed at (of course all WINX features shall be
included).

The first version will be a Pure-C library which can be linked to
your programs in order to simulate an AES. This makes sense for
testing purposes and except that you could be able to write auto
folder programs with a graphical user interface.

MiNA will not include a desktop program but there are a lot for the
Atari anyway.

I would appreciate if people intrested in the project could contact
me so that I can get an overview of the situation. It doesn't matter
whether you'd only want to use MiNA, test it, or even contribute to
programming, documentation or similar.

This week I wrote the resource and object functions (without 3D and
edit). In about four weeks time the first source code shall be
published (if my job doesn't take too much time and my starting elan
doesn't cease ;-).

Greetings, Martin

>for one partition without changing (affecting the others).

ICD (pro) can do that.

But what do you want to change, anyway? If you change the sizes, at least a
second partition will be effected, too.

BTW, could you possibly restrict your linelength to < 80 columns? TNX!

286. Mac/Atari Syquest 44MB + Atari 520stfm 4SALE

Newsgroup: comp.sys.atari.st
Date: 1995-04-07 00:00:00 UTC
From: fusiong@STD.Teradyne.COM
Message-ID: <9504072211.AA00323@std.teradyne.com>
Source record: 167973

Atari 520stfm, Monochrome Monitor some SW, best offer.

44MB Syquest Drive. Custom built by Carter Graphics. Has
DMA port for Atari use. Has 50-pin Centronics SCSI port for Mac
use. Switch switches between the two. Works pefectly.
Used sparingly. Includes ICD host adapter and cable for
Atari use. Best offer.

No cartridge.

contact: fusiong@std.teradyne.com

>Could anyone tell me if I am able to run these programs on my computer?

Wait a minute... let me guess. You are a REALLY new user, right? :)

You cannot run programs written for the Atari on a DOS box anymore than you
can run Macintosh programs on it. Different systems, different software.
The only way to run Atari software on a PC is with the use of an Atari
emulator such as Gemulator or Janus, both of which are commercial products.

There are versions of GFA BASIC for both DOS and Atari (plus Windows and
Amiga) but they are not compatible. Again, totally different systems.

You'll have to stick with games designed for your DOS machine, I'm afraid.

>both. This is Plug-n-Go! $460 shipped to your door!

Considering that this is new in a nice ICD case, includes the ICD host adapter and ICD utilities, I guess this isn't really a bad price. But with new Quantum 540Mb drives going for just $225 (bare) and the 730Mb ones at $259, it won't be for long. ;-)

289. WTB: Monitor for 1040ST

Newsgroup: comp.sys.atari.st
Date: 1995-04-07 00:00:00 UTC
From: Phil Heaven <heaven@pacificrim.net>
Message-ID: <3m40vq$f54@baja.pacificrim.net>
Source record: 167976

Hello,

I need a high resolution monochrome monitor for my Atari 1040ST.
The one I am borrowing (and thusly replacing)(that works well) is a Quantum
QC-1438S, although it says ATARI on the front.
If you have one for sale or have a good idea as to where I can get one,
please E-mail me at heaven@pacificrim.net, or call me at (360)-734-3240.
You could possibly even leave a message for me at the 800 # below, but it rings
in Tucson and I am in Bellingham WA.

Thanks a lot!!

From: satty@cix.compulink.co.uk
Message-ID: <D6op78.GIG@cix.compulink.co.uk>
Source record: 167977

Whta version of the Atari Hard Disk driver are you using? My Falcon shipped
with V6.061 and whenever I tried to optimise the disk I got exactly the
same problems. I have now solved the problem by :
a) downgrading to V6.05 of the driver
b) Terminating the SCSI bus using an active terminator

It aparently has something to do with the timings on the Falcon SCSI bus

Hope this helps

Steve.

291. FS: MegaSTE & other stuff...

For sale the following items:

1.....Mega STE[16Mhz] 4 Meg of Ram w/BeetleMouse and Joystick $499.00
2.....Canon BJ-10ex Inkjet printer[360x360 dpi] $249.00
3.....Nova VME Plus 16.7 Million colors [32 Mhz] $349.00
4.....Atari SM147 14" Mono Monitor[almost new] $100.00
5.....Zoom VFDX {Voice/Fax/Modem} 2400bps/9600Fax{basically New} $ 89.00
6.....Migraph HandScanner with OCr jr and Touchup $110.00

Alll this Items are in box with Manual and everything, and of course they
all are in excellent condition. You pay shipping.

If you are interested e-mail me at mayolc@ucunix.san.uc.edu

292. Mega 2 as X terminal?

Newsgroup: comp.sys.atari.st
Date: 1995-04-07 00:00:00 UTC
From: cgreuter@calum.csclub.uwaterloo.ca
Message-ID: <3m4hdp$oj1@calum.csclub.uwaterloo.ca>
Source record: 167979

I know this is a FAQ, but the FAQ list seems to have vanished. It's been a while since I've read this group, you see. Anyway, I have a Mega II with 2 megs RAM, hard drive and monochrome monitor. Since I bought a PC (yes, I'm a traitor to the Atari cause--sue me ;-), it's been gathering dust.

It occurs to me that I really could use an X terminal, so I'm wondering if there's a way of running a dumb X server under TOS. Failing that, I'm willing to try MiNT and/or memory upgrades.

(If there's still a FAQ available, would some kind soul please mail me a pointer to it?)

Barry Heath (barheath@heathen.demon.co.uk) wrote:
: In article <3lulmj$ei3@sphinx.Gsu.EDU>
: gs01tph@panther.Gsu.EDU "Tommi Pekka Hietavuo" writes:

: : But for the "rest of us", I think there are two more interesting
: : alternatives. One is MacMagic, of course. I have doubts about whether a
: : Mac can ever replace e.g. a Falcon - the design of Macs (keyboards,
: : mouse, strange disk drive, flickering 640x480 display, etc.) just doesn't
: : make me happy at all. And too many programs seem to have problems with
: : MacMagic, as well. Some people, besides, love MacOS - but I rather hate
: : it. It's as stupid as a cow. Easy, but stupid.

: I wonder which Macs you've been looking at?

Most recently, Performa 660AV and Quadra 700. And not just looked - used,
a lot.. Both with MacOS and MacMagiC (testing its program
compatibility). Both Macs and PCs are familiar to me, even though I don't
love either. But anyway, it's better to know something you criticize than
just speak empty words, and show your prejudices, I think. Mac has been a
big disappointment for me - especially, because I quite recently planned
to buy one... After using them more, I chose the more expensive, and
more strange alternative: Falcon. It just felt better for me, couldn't
help it.

: I've just succumbed and bought a Performa 630 with Apple 15" M/S monitor,
: and the display, in ALL resolutions, is steadier than my STe in mono. Nary a
: flicker.

Apple has many displays, like most computers do. I agree that the 15"
display is good, if rather expensive too. But the 14" displays I use
almost daily are pretty awful. Flicker a lot.

: Why did I buy it? Not a lot of option really. The ST is, as a commercial
: Price was a factor, too. A Falcon with reasonable memory and HDD would cost
: around 1000ukp. Add a suitable monitor and we're getting near to 1300. Me
: Mac has all that, plus CD-Rom built in, for under 1300. Massive worldwide
: support amd software base, Atari capable with MagicMac, a plug-in 486
: available, and upgradeable to PowerPC processing while still retaining full
: software compatibility.

I understand well your reasons. I might do the same, if I could stand the
(so famous and well-liked..) MacOS, and that keyboard. I never seem to
get used to it, unfortunately.. But I wish people would stop speaking
about "full software compatibility" of MagicMac. Because my own tests
have found that to be more hype than facts. Far too many programs I've
tried had either serious problems (especially graphics prgs in 256 color

mode), or wouldn't run at all. The demo may be incomplete, and create some of these problems - but anyway, not all. MagicMac is an impressive piece of software, but as it is now, it doesn't replace a real Atari computer for most users.

: I just wish it had GEM too.

So would I. Then it'd be an alternative for me, too :-)

: : The REAL alternative may well be the Eagle. A German TT-clone, twice as
: : fast as a TT, and very easy to upgrade with 68040, or even 68060.

: Where from? no sign of one in England that I know of. My Mac has a 68040
: already.

GE-Soft, in Germany. It's been in production only a short time, so it's no winder it hasn't spread outside Germany yet. The machine seems to be very promising, though. Especially, if GE-Soft can keep their plans of one VERY cheap model... Those Germans have done some miracles before, in Atari front (take Calamus for example) - so who knows?

: Atari's problem has always been the afterwards. The initial concept has
: been excellent from the old 400 onwards. The support and backup has been
: crap.

True.

: I'm sorry they've effectively died; I just can't bring myself to be
: surprised.

Nobody can, I guess. But it isn't a dead computer at all. The reason is this: there are too many people like me around, who just can't find any alternative to Ataris. We won't leave the scene easily.

That's why MagicMac was created, too. For people who want TOS instead of anything else... Sometimes I wonder why I can't believe that "100.000.000 Windoze users can't be wrong". Maybe it's because they can.

Greetings,

TH

> Has anyone heard anything about Magic for the Falcon? Have they delayed
> it because of the MagicMac project?

No. MagiC v.3 has just been released for the ST, STE and TT machines. Behne&Behne are still working on MagiC 3 for Falcon. They're optimising some things in MagiC 3 for Falcon, they're working on making MagiC use the DSP more intense than before for faster operations.

And by the way, it was not with Behne&Behne's good will that MagiC 3 was released for the other machines before the Falcon-compatible version was ready.
It's due to pressure from Application Systems Heidelberg who is distributing MagiC, that the ST/STE/TT-version was released before Falcon-comp.

I think it's a very VERY! good idea. It's about time someone start code
on a program which doesn't need Mint or X windows, as i feel many people
are having many problems with these programs.

309. VIRUS?? Stop, the system is out of memory!

Newsgroup: comp.sys.atari.st
Date: 1995-04-07 00:00:00 UTC
From: henk@elrond.Simplex.NL
Message-ID: <FDHSAAUQUp@elrond.Simplex.NL>
Source record: 168190
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Since some time I regularly get the message

STOP! The system is out of memory.

After this message I can carry on mostly, but windows that were
open are closed and not everything works any more.

I suspect there is a VIRUS in my system somewhere.

Is there anybody with the same experience or just knowledge
about this subject?
Please, come out and speak up!!

Henk

(BTW: I have a Mega 4 ST and TOS 2.06)

] Chris> would have to be on-chip, e.g. between a register and
] Chris> on-chip RAM/ROM. Or am I deluded? --
]
] I was under the impression that the 56001 had 3 busses to
] external memory. I thought that NeXT's had 3 16k word busses for
] their 56k's. The 21xx in my pc works as described above. If the 56k
] treats external memory the same way, would someone tell me before $800
] falls from the sky and I buy a used falcon.

The 56001 is capable of three external memory transfers per cycle,
one to X memory, one to Y memory, and one to Program memory. The Falcon
has three memory areas to support these (although they do overlap a bit).
The confusion may have arisen because each memory block (X, Y, or
P) can obviously only have one access per cycle.
Go ahead and spend your $800 (that's a bit much for a USED Falcon
isn't it?)

Message-ID: <199504071007.MAA17693@mail.swip.net>
Source record: 168192

```
Hi there!
I got your address via "Atari8@netcom.com" when asked if there was any=20
chance of getting in touch with someone who could help me regarding some=20
strange SCSI-errors on a Falcon 030, together with an IBM 1Gb HD (Fast=20
SCSI-II).
I'll try to give you a brief description of the problem - since there might=
=20
just be (not very likely though, as I see it) a simple solution to the=20
problem. Ok, I've low-level formatted the HD with the Atari-programs that=20
came with the computer (AHDI etc.), partitioned the HD into either four=20
250Mb units, or into three units (2*250Mb, 1*500Mb) - neither way is workin=
g=20
properly. It all seems to be working fine as long as I don't attempt=20
reading, or writing any larger files. As soon as I do that, the HD "locks=20
up" and I get the error message "Your output device is not receiving data".=
=20
The only way to get pass this is to reset the computer as the "Retry"=20
function simply does not affect the HD-status ("Busy"-light constantly lit)=
```

*** NEW 540MB SCSI HARD DRIVE IN ICD FA-ST CASE FOR SALE ***

I only have one, but I might be able to get more if there is enough
interest. This is a _NEW_ drive in a _NEW_ case with warranties on
both. This is Plug-n-Go! $460 shipped to your door! (+$5 COD)

Here are the specifications:

o ICD FA-ST Hard Drive Case
o under-monitor designed case w/adjustable legs & fan
o DMA input and output ports
o external ID-switch
o external SCSI connector for further expandability
o internal expansion for second 3.5" SCSI HD

o ICD AdSCSI Plus ST Host Adapter
o full SCSI command set
o parity bit generation
o dual mode DMA daisy chaining
o battery backed real-time clock

o ICD Hard Drive Utilities (+$40 for SCSI PRO)

o Quantum MV540S 540MB SCSI hard drive
o low profile 1" x 3.5" form factor
o 14ms average seek time
o 5MB/s max. transfer rate
o 128K cache buffer

If you are interested please leave me e-mail here or at the following
addresses:

CompuServe: 74030,3254
Delphi: DOMINGO
GEnie: D.ALVEAR

I only have one, but I might be able to get more if there is enough
interest. This is a _NEW_ drive in a _NEW_ case with warranties on
both. Requires the Link 2 or other host adapter. $360 shipped to
your door! (+$5 COD)

Here are the specifications:

o External 3.5" SCSI Case (W6.5" x D9.75" x H2.375")
o horizontal Desktop or vertical Mini-Tower
o external SCSI ID switch & 2 SCSI ports
o 40W p/s & 1.5" fan
o second AC outlet

o Syquest SQ3105S 105MB removable SCSI hard drive
o low profile 1" x 3.5" form factor
o 14.5ms average seek time
o 4MB/s max. transfer rate
o 64K cache buffer
o 105MB cartridge _INCLUDED_

316. Re: Falcon030: 80 columns at bootup?

Newsgroup: comp.sys.atari.st
Date: 1995-04-07 00:00:00 UTC
From: Patrice Mandin <i2a06a@iut-nantes.univ-nantes.fr>
Message-ID: <3m33uu$177@caro.dsic.emn.fr>
Source record: 168197

It is very easy to make a program which changes to mono rez:
Assembler version:

```
move #2,-(sp) ; Setscreen(0,0,2)
pea 0 ; this works only on Falcon
pea 0 ; Cause giving 0 as video adress
move #5,-(sp) ; will force a reallocation
trap #14 ; of video memory to right size
lea 12(sp),sp

clr -(sp) ; Pterm0
trap #1
```

This takes only some bytes for a file (680x0 rules !!).

For those of you who missed ACE '95, or at least Sunday's part of the show, and will be in the Toronto Area April 20th (third Thursday), TAF has invited Sam back for the TAF General meeting for April (7pm at the North York City Centre: Memorial Hall).

For more info about TAF check out our WWW page at:
http://www.io.org/~schrist/taf.html

I'm working with Sam to try and release his current setup threw the TAF library. (Anyone have a TT RAM board for sale?) This isn't going to be like installing your basic Terminal program (which throws a lot of users). So anything you can do Sam, PLEASE go for it!

BTW, I haven't seen any comments on ACE on the net? What are people's comments? (Including those of you who didn't come - why didn't you come?) I would like to hear some opinions to take back to the Executive meeting.

Does anybody still use Atari ST hardware/software ??
I havn't used mine in a long time, and I'm thinking about getting
rid of the stuff. I have a mega 4, Syquest drive, hard drives,
Spectra, 1040stfm, 300+ pieces of software. I would like to
get a good price, make me an offer if interested, suggest
price, I'm flexible. Leave E-Mail if you desire a list of
software.

Petra..

323. Falcon030 for sale anyone??

Newsgroup: comp.sys.atari.st
Date: 1995-04-08 00:00:00 UTC
From: Peter_Epp@learnnet.nt.CA
Message-ID: <351846.ensmtp@learnnet.nt.ca>
Source record: 167996

Does anyone out there have a used Atari Falcon030 computer they want to sell for a reasonably good price? I'm looking for one that comes with all kinds of goodies like upgrades, software, CD Rom, etc. Either way, though, I am interested in buying what you have. I would prefer if it has an Atari SC1435 monitor with it, but if all you have is a standard Super VGA, then that's fine. If you don't have 14 MB of ram, though, then it had better have a LOT of other extras to make up for it, because I really want 14MB. However, I suppose I can live with 4MB if that's all you have, but anything less than that I am sorry to say I would not be interested in. Unless Ram up-grades are not too expensive and easy to install. Also, I want a 486SX processor board for it if that is available, as well as whatever software you need to use it.

Thanks in advance to any and all.

Pete

>I have 4 - 1meg SIMMS from my STe. [8 pin/bit(?) as opposed to the extra
>parity pin(9) in IBM SIMMS]. Does anyone know if these are usable in either
>the GIZMO ram board or WIZZTRONICS ram board for the Falcon?

The Ram Gizmo board will take 1M simms - but of course that will only
give you 4M on the board. The board also takes 256K and 4M simms for
1 and 14M respectively. It can use either parity or non-parity simms
as long as the simms are 30 pin.

I believe the Wizztronics board uses 16M simms - for 14M - not sure
if it can use smaller simms for less memory. Wayne

PS- Anyone interested in upgrading their Falcon to 4M with the
Atari 4M board, contact me. I have two of them as both my Falcons
are now at 14M and would make you a good offer. Wayne Booth

> --Chris

This should be possible. I would certainly advise you to upgrade to 4meg...
You have to install MiNT, MiNT-NET, X11 for MiNT and all the network utilities.
Then you could make a PPP/SLIP connection between the Atari and (I presume)
your PC, set the DISPLAY environment variable to your Atari Display and
get the ting on the road. (I tested this, It works). You can find all the
files at the atari archive or its mirrors...
If you have any questions left, you can email me.

Good Luck

Florentijn

>places (or from me, too).

I would also like to see an drag&drop application, that plays (and maybe
displays sounds (WAV, AIFF, SND, AU, DVS...). If that wonderful 525
could be programmed to play the sounds also, I would be very happy.

BTW: has anyone else got this problem:
When exiting Fortune or 525, the desktop colour nr.9 is not set to it's
original value, but always to R500 G500 B500. Is this because of those
programs of the COLORVDI.CPX vr. 2.10?

331. Atari E-mail List update

Newsgroup: comp.sys.atari.st
Date: 1995-04-08 00:00:00 UTC
From: sirsmedley@delphi.com
Message-ID: <Je6e4S8.sirsmedley@delphi.com>
Source record: 168004

The Atari Community E-mail Address Book
Revised 8-Apr-95

Hello all! This list has been compiled to provide Atarians worldwide with the addresses to contact other members of our ever-changing Atari community. The list has been re-organized since the last update. There are now 4 distinct sections - user groups, Atari computer contacts, Jaguar and Lynx contacts, and World Wide Web pages. Please note that for addresses that are of interest to both Atari computer users and Jag/Lynx owners will be found in the cmoputer section. Oh, and special thanks to Ron Whittam who published some of his e-mail contacts in AEO_0404, which accounted for at least half the new entries in this revision - including his user group!

Using this list -
I created this list to encourage communication between Atarians everywhere. If you have a question without an answer, or are moving soon and need to find a new user group, this list should help. It is also a great way to distribute Atari related press releases, such as upcoming Atari shows and new product announcements. And I would LOVE to see user groups sharing newsletter articles via these addresses! However, it SHOULD NOT be used as an advertising tool. If you are a retailer looking to advertise, please contact the individuals on the list and ask if they want to receive your mailings. Some people must pay for their e-mail by the character and would not want unsolicited commercial mailings.

If you have any changes, additions, or suggestions, please contact me via private e-mail. My addresses are listed under AUNT.

Dan Mazurowski, AKA Sir Smedley
Semi-official e-mail contact for AUNT

PS - This list may be printed and distributed at will, though I would like credit for compiling it. Please be sure to contact me for the latest update, as I won't post every minor change.

PPS - Will the guy who sent me the address of the group in Tasmania, Australia please send me the address again? I lost it! (Sorry!)

Get NVRAM11.??? from a.a.u.e or anywhere, I had a same problem when
I installed AT-Keyboard on my machine. Also, there was a program for
resetting NVRAM. I think this will cure the problem, too.

Eugen Bienko has a variety of hardware ST's, megas, sysquest, monitors,
Mac emulator, video key, etc and software for sale.

His phone number is (310) 534-3984

e-mail Ebienko@aol.com

335. Falcon for Sale

Newsgroup: comp.sys.atari.st
Date: 1995-04-08 00:00:00 UTC
From: em129@cleveland.Freenet.Edu
Message-ID: <3m6s7j$fv3@usenet.INS.CWRU.Edu>
Source record: 168008

FOR SALE:

Falcon030/4/84 w/AtariWorks, SpeedoGDOS, complete package in original packaging. Also, VideoMaster Falcon, a real time video digitizer and LOADS of software, including GFA BASIC, Transarctica, Sim City, etc. Will sell for $800 + C.O.D. shipping charge.

Also, Atari Jaguar with two controllers and the following titles:

Cybermorph
Raiden
Alien vs. Predator
Tempest 2000
Zool 2

In original packaging. Will sell for $175.

Buy both the Falcon and Jaguar for $950.

If interested, e-mail me at:

336. Pinouts Please ?

Newsgroup: comp.sys.atari.st
Date: 1995-04-08 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <04081995.214303@empyr.dircon.co.uk>
Source record: 168009

Can anyone tell me how to connect my ST to a monitor that has Analog and TTL or Video inputs ?

I need the pinouts of the long D-type socket on the back of the monitor, or pinouts for an EGA / VGA small D-type plug.

Can anyone help please ?

Thanks.

Kevan@empyr.dircon.co.uk

337. q. about coverdisk software

Newsgroup: comp.sys.atari.st
Date: 1995-04-08 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <3m6u1i$9jo@sinsen.oslonett.no>
Source record: 168010

I have a bunch of ST Format magazines that I'm planning to sell/give away, but there are a few commercial programs on some of the cover disks that I'd like to have.
I was just wondering if software like this can be copied or if they're treated in the same way as if you buy the actual software by itself.
I'm in doubt since the software is free (included with the magazine).

Message-ID: <3m70rj$s69@news.cc.utah.edu>
Source record: 168011

I have a question about James Ingram's democode.zip file on
phlem.ph.kcl.ac.uk in /pub/atari/demo. The zip appears to be corrupt...
Does anyone know where I can get a good copy of the file? I've checked a
lot of the other ftp sites, including three others in the UK, and haven't
come across another copy.

Thanks very much.

340. CurrNotes expert contest (BIG!)

Newsgroup: comp.sys.atari.st
Date: 1995-04-08 00:00:00 UTC
From: dsmall@well.sf.ca.us
Message-ID: <3m74tl$1ak@nkosi.well.com>
Source record: 168013

Here is the programming contest from Current Notes magazine.
I promised I would post it to the Net, and as you'll see, you can
reply via snail-mail or through the net.

Looking it over month s after writing it, it may focus a bit
much on the Spectre GCR -- but that's what I was up to.

There are two parts:

a) Do a demo that knocks our socks off;

b) Get al 50 questions right in the quiz.

(Wish I was handier with that text editor...)

Anywho, I hope you enjoy -- I even left in the notes-to-Editor --
because that's the only real reason to do it.

I did try to get out on the subject line this was a LONG download,
so you could skip it if you wished.

Clock starts now, folks!

THE International ST/TT *Expert* Programming Competition

by: Dave Small

Copyright 1994, all rights reserved.

NOTE: This is different than most articles in CN in that
this may be copied provided (please!) you copy it
intact. I would appreciate translation to other
languages very much, especially if you re-post the
translated version to a BBS or network, so that others
can enter this competition.
---

* * *

*** Caution: This is for experts. Unlike many columns I write,
this one is Not For Beginners. ***

* * *

==========
EDITOR: Do you think you could put a fairly light grey-tone
"EXPERTS ONLY" (maybe "WIZARDS ONLY"? [ask Joyce] her opinion)
across the page at an angle, as a "stamp", sort of like a

security classification would be?
==========

Introduction:

The Expert's Competitions

Over the nearly 10 years I've programmed the ST, I've met a lot of *really* good programmers from all over the world. Briefly, from Charles Johnson to Jeremy (Jez) San, from "AutoSwitch Overscan" to "Spectrum 512", there has been *astonishing* wizardry and talent turned loose on the ST and TT.

(I'll start using the word "ST" to cover the full product line from 260-520ST to TT to Falcon now, ok?, to save room. The Jaguar is not included as most people can't write code for it; it requires special, expensive tools).

So, for your *enjoyment*, I would like to present a top-level, "warp drive", *absolutely the most difficult programming contest* I can do that should stretch the talents of the best, to find *who is the very best* out there.

Now I *know* not all of us have time right now to put together a demonstration program, even though, say, we've been programming on the ST since '85; some of us are busy doing other things (like, say, writing Current Notes articles, *grin*).

So, to "balance" this competition more fairly between people who have time to make a great demo of their talent, and people who don't have time, but work (or have worked) on the ST, there are TWO contests:

1) A Demonstration Program: Show Us Your Best!

2) An Expert-Level Quiz On The Atari (coming right up; see below)

* * *

Remember, there are two *seperate* contests here.
(Although, you are WELCOME to enter both!)

* * *

The Prizes

The most important Prize is to be known and acknowledged as the best there is, here in Current Notes and on the worldwide InterNet, specifically in "comp.sys.atari.st", and elsewhere.

As a token of *our* esteem, two Spectre GCR's are reserved, the first, for the *most* impressive Demonstration of Programming, the second for the person who gets the *most* questions *right* in the following Programmer's Questions (they're after the Demonstration section.)

Finally, a Certificate

Contest One:
First: Show Us Your Best!

The FIRST is a straightforward contest to, frankly, "impress us" -- to do your *very best* wizardry, a "demo" or other type program, (or, to just send in one you've already done.) Believe me, I have seen some really awesome "demos" done for the sake of a demo -- but I have definitely NOT seen them all, just a few that came over from Europe. About 10 disks max. I know there are FAR more.

The Demonstration Contest is a "*what can you DO*?" when you REALLY roll up your shirt sleeves and *go for it 100%.* We're talking staying up all night (I've done it too!), "pulling out all the stops", drinking coffee or anything with caffeine, and "throwing in the kitchen sink" here.

(I understand those phrases may not translate properly from English; if you're translating this from English, *please feel free* to change them into something appropriate meaning, "doing your very best". Or, just explain, "they don't translate directly", but tell them, "here's the essence of it:")

For those of you here who don't know, making up a "demo disk" and spreading it around to show you're Top Gun in programming is an art form in Europe.

For example, I am particularly amazed at whoever figured out how to put text in the HBLANK (horizontal blank) and VBLANK (vertical blank) areas! (See, the ST is setup in hardware to "blank" those areas out, to make a border -- but someone figured out a way around it!) The point isn't that lots of people know to flip Display Enable at the right microsecond; the POINT is the first person to figure it out and go, Wow!

Now I realize this is not a new trick in 1994; this is an EXAMPLE. It took a lot of work to count cycles and "walk in" the timing. This would be a high-point thing if this contest were held in 1989.

NOTE: You should know that we over here "in the 'states'" (U.S.) often don't get to *see* MOST neat demos. (And we get confused a bit by the messages in them, saying, "THIS demo is to show those programmers at xxxx that We Are Better, so there!", and such. Because WE don't know WHO xxxx is, it's all mystery to us! (If your demo has this, that's okay, but would you mind telling us What's Going On?!?))

For instance, there was a demo of digitized pictures, if I recall correctly, of an ocean cruise to meet with other ST

programmers and put out a demo ...

Now, in this competition, I don't as much mean commercial ST products, because not everyone can get something *just amazing* into retail channels to sell, and "straight demos" done for demo's sakes aren't that saleable. Remember the spirit of this; we're looking for the *very best*. Now, if it so happens *your* very best is commercially sold, we have no problem with you entering it in the contest; there is No reason to exclude people who "program for a living" from this!

I would recommend sending only disks and a README file on what is great in what you're sending. (Of course, NO DISKS WILL NOT BE COPIED WHATSOEVER). See the section on mailing entries in for some good advice about disk return, though; it is unlikely your disk will survive two trips. If you want us to reformat the disk when done, just say so; disks are so cheap these days it's more practical to do that than try to return it.

Criteria For Judging

Sandy and I will be judging demo entries based off, to be utterly honest, a mix of factors listed below, but summarized as:

--- The most important thing is us feeling your love for the machine and your talent put together into something great. ---

==========
EDITOR: Can you indent and "dot" these? On a Mac it would be OPTION-8 (just a circular dot, bigger than a period).
==========

FIRST: the "Just How Far Our Jaws Fall Open Factor"; how AWESOME it is. Does it make us look at each other and say, "Wow!!!" Are we talking "Jurassic Park T-Rex" here?;

(Example: Remember the *first* time you saw a program that *really* impressed you? "Blew you away" is an English phrase for it. "Dungeon Master?", say? "CAD-3D"? "StarGlider"? "AutoSwitch Overscan's" Falcon Demo for the Atari Messe?

Do remember to tell us how to get to your demo... does it autoboot? What keypresses? And so forth.)

SECOND: on our knowledge of *just how hard* it was to *get* this effect, *to do what you did*;

(Note: you can *help us here* with a README file, or a letter, explaining what *precisely* is so unique and difficult in your demo; see the questions below to get an idea of the sort of difficulties *w*e have been through; look, if you've fought through a tangle of obstacles, TELL US!)

THIRD: "Rock and Roll, Doing Something Impossible" Factor.

Remember, you're dealing with a person who put a digitized sound file 125,000 bytes long on the Spectre 1.51 disk, *just* to show you how it sounded in my heart to "break through the impossible" barrier!) Example: the wild *but perfect* *fastfastfast* re-sizing and displaying of text font size, a PostScriptish effect but *incredibly fast*, on an 8 MHz ST that is already being cycle-clocked for horizontal and vertical blank additions; that is very, very impressive!),

FOURTH: Music is usually part of any "demo disk", but there are demos and applications it just doesn't belong in. You won't have points subtracted for not having sound (for example) in a word processor. If *you* feel music belongs, and you do something nice, points definitely added! Please: we're not asking you to be an Academy Awards musician (as one ST programmer is!), just to have music that has your *heart* in it.

FIFTH: if there is a special artistic or technical merit to what you have done. This is also how generally "neat" and "cool" (I hope the word "cool" translates okay; it means "very highly impressive" in this context) what you've done is.

(Example: Just about anything that is different and special. Spectrum-512 showed 512 colors. Tempus scrolls at frightening speed. See what I mean?)

Judging in General

Please realize that of course all such judgings are relative; I expect we'll have a few choice arguments here on which is the *very best*. (And if we just can't agree between two, we will honor BOTH.) We will also likely honor "Honorable Mentions" that are extraordinary in some way.

In some cases, we'll call in the experts: our kids (now ages 12, 11, and 6, for those of you who remember me changing Jamie's diaper at the Glendale show when we released Spectre 128) will be asked which demo is more *awesome*; they *commonly* start-to-finish a Sega game in *one day*, and have a good feel for computer generated images. (I think the testing side of Sega would commit hari-kari if I sent them a video tape of my kids ripping up a program that took a year to write and test in one day).

Bear in mind I've seen many seriously awesome programs, both commercial applications and demos-as-demos, for instance, MIDI-Maze, Jez San's disk that boots on both the Amiga and ST (A-MAZing!), the "Union Demo", the "infinite number of desk accessory" programs, even new desktops. Yet this does not mean you haven't got something so special, so unique, it won't win! We won't bias our judgement towards manuals or packaging, or commercial, "team" programs; we're looking for something you've done specifically to show you're *good*, and the kind of

dedication it takes to get it onscreen on the ST.

Okay, that's the spirit; let's go over the usual entry requirements.

Equipment Needed To Run

Assume an 8 Mhz, 4 Megabyte Atari 520-ST, your choice of color or mono monitors (let me know!). I can crank down the memory if necessary, but, uh, would prefer not to, really! (I don't like putting static electricity into my machines any more than you do.) But look, if you need more CPU to pull off "your vision", we have Mega-STE (16 Mhz cache), TT-32 Mhz, and Falcon-030 machines here, with *all types* of monitors, from SC1224 standard color (320 x 200, 640 x 200, SM124 Mono (640 x 400), to VGA (640 x 400), and TTM-194 Double-Page High-Rez (1024 x 768, if I recall correctly), plus the other TT rez modes, as well as Moniterm monitors that run on the Mega-ST, and "Crazy Dots" boards running the Tseng video chip. I don't have any other specialty boards (although I do have an AutoSwitch Overscan that I still need to re-install; the machine it was in died of age).

HOWEVER: Remember: While higher horsepower is nice (by definition, it lets you do more per second), that isn't what we're after necessarily.

--- The most important thing is us feeling your love for the machine and your talent put together into something great. ---

Entering Is Simple!

So, if you'd like to enter your favorite work, all you have to do is *send it*. (PLEASE, please, send it in a "disk mailer", or AT LEAST between two BIG pieces of cardboard, lest the postoffice "festflatten" it! We get too many bent diskettes we can't read otherwise; one-half of the Spectre disks we get returned for upgrade are destroyed!, literally bent, some bent IN HALF (especially on the way from Europe).

On returning disks, let me tell you, it isn't worth it to you or me. Disks are so inexpensive now that it is not worth the postage rates. The other problem is you will probably get back a disk that does not work, or worse, *is not reliable*, a capital crime for a disk. Don't think I'm trying to increase my disk collection; remember, some of the disks will arrive here bent, and, I already have, what, about a thousand disks with various stuff lying around.

I do need to keep them for the length of the contest, so I can compare early entries to later entries.

Or, Electronic Mail

If you wish to upload it, (Good Idea!) which I could well understand given my experiences with various Postal Services, here are some routes.

My account on GENIE is DAVESMALL (no quotes); CompuServe, 76606,666 (no kidding!), and on InterNet is dsmall@well.sf.ca.us.

NOTE: Uploads are *generally free* -- you are not charged connect time. The Gadgets by Small RT on GEnie will be happy to accept your upload; if that doesn't work out, I can try and make a deal with the main Atari ST RT people.

Also, both GEnie and Compuserve can now be reached via Internet; *however*, I don't know where file transfer is on these systems yet. Oh, PLEASE, don't send me a 800K high-bit-stripped Unix "shar" file to decompress, then "compile with Beirut 'C', ok, Dave?" Please send executables and enough documentation to fire them up and make them work.

It is *possible* we could set up an anonymous login FTP site *for uploads* but I cannot guarentee this; the local Net situation is, uhhhhh, "interesting". (Which is why I keep using a San Francisco system, The Well, instead of the local Net.)

If you send to me electronically, *particularly via Internet*, *please* tell me EXACTLY *what to do* to get your demo to the ST properly and run it. *We do want to see it!*

PLEASE INCLUDE EITHER A README FILE (on disk is fine, or letter) TELLING ME HOW TO GET IT INTO THE ST AND RUN IT.

About other ways to send it (disk/e-mail)

A plain ol' .TOS, .PRG, .ACC, or .APP is fine; however, for your sakes, bear in mind the compressors have CRC checking and thus will tell me if your disk went bad on the way ... sometimes I think they ship my disks next to a big magnet load. Personally, I'd send one compressed and one not-compressed; the cost of 2 disks is very low.

So, an .LZH, .ZIP, .ARC is fine, but PLEASE send me the de-compressor too; there are getting to be too many incompatibilities in the various formats (e.g., .ZIPver1 won't work with .ZIPver2 files, etc.) In other words, if you send me DEMO.ARC and want me to de-ARC it, *please* send ARC.TTP (or whatever) to un-ARC the file! I may not have an ARC that is compatible with yours; there are several different ones.

A disk-image program that makes an entire disk into a file is acceptable if you need the space or the demo was written that way originally (for electronic mail).

I will try to return disks that fail or got smashed by the mails, or let you know it happened; same goes for entries via

electronic mail. If you have a Net address of some sort, please send it along; I will be *trying* to send acknowledgements that I got your entry, but may get drowned in them.

In your README file / letter:

Let me know, please, how much RAM it should have (or I'll assume a color, 4-meg ST) and whether or not there are any things I need to do, like disconnect the hard disk, use 10-sector floppies, or *whatever*. If needed, *PLEASE* send instructions if I have to do something special (e.g., use a keypress or joystick to open various "doors" to various demos). My kids seem to have genetically gotten all my skill at finding "hidden doors", along with most of my hair ... *sigh*, so don't hide your work from me!

If you want published credit, *PLEASE* send me your names or pseudonyms. *Group efforts count just as much as single efforts* and I will list the names on group efforts; if you want to tell me who did sound, scrolling, etc, please do. Please type or print your signature along with signing your work, so I don't foul up giving you credit. (Please double-check your name's spelling; you'd be surprised how many people miss this.)

PLEASE indicate with your entry, provided it is somehow uploadable/downloadable, or could be put on a Syquest (e.g., doesn't munch out the hard disk drivers, or can be "disk imaged" into a file):

a) if I can put a picture of the screen in the magazine; (this includes possibly the cover, in color)

b) if you WANT your entry uploaded and generally sent around, in the USA; (if not, it will not be sent anywhere);

c) If you want your name listed, or a pseudonym, for privacy;

d) if it is okay for Current Notes to include it in a collection for ST users in the USA, probably on SyQuest disk.

The reason for this is Current Notes makes a great deal of PD/Shareware software available at a really reasonable price via 44-meg Syquest removable disks, which is very useful for people without a local user group (of which there are lots!). We really have not seen MANY of the really good demos here in the 'States and many people would like to.

(I do understand that some demos make it a point to be hard to copy. I would appreciate you disabling this IF you want the disk sent out into the world.)

Now, if you DON'T want this, your disk and work won't leave my office, and if you want privacy, okay. I will still mail you a prize and scroll.

There is, of course, something else in this for you ...

While it isn't *everything*, being mentioned as "one of the very best programmers" is something worth having, and *if you want*, I will be *happy* to list your name for an employer's consideration. (Or, just photocopy the article). Believe me, anything a little different, a little "better", about your resume, makes it stand out in a pile of other resumes. It says a lot about you that you self-started, tried, and won a competition -- believe me. The quality of entries is going to be very high here.

Again, when listing winners, I'll list your name if you want; let me know if you'd like your entry to be anonymous, or under a pseudonym, let's say, if you work somewhere where having your name on a "demo" would be bad news. (I have had to do that in my past; I understand!)

Second: Show Us Your Working Knowledge

The Other Contest is a set of questions immediately following, which cover some *working knowledge* of the ST which can, in my opinion, ONLY be acquired through long, hard experience and work and really "hanging in there" (look, *where do you think I got these questions*? I found them out *the hard way*, on the ST since 1985, folks.)

If you haven't programmed the ST, you may find them entertaining, in an odd sort of way...

So here's some questions about the ST. They are generally "been there, done that" sorts of questions that really good programmers have had to solve; and because of what I've been doing (Mac emulation), there's a few related to that as well.

The rules are simple. The FIRST entry (as judged by postmark, so everyone starts at the same place) with the maximum number of right answers wins. In case of a tie, I'll think of something.

You can email me the answers at the addresses above; they will count as being "postmarked" *when you mailed them*. Look, there's no way I can be responsible if a machine on the Net sits on your mail for a few hours, any more than if a letter sits in some post office en route for a few hours; fair is fair.

I honestly don't expect anyone to complete all of these questions correctly. I will be very pleased if someone does! (Actually, some time in front of a keyboard will answer a number of them; getting to the point where *I understood the problem*, and can so quickly state it here, is what took so long over the years, so maybe I'm overstating the difficulty level.)

I also spent some time looking through listings, looking for
comments saying:
*
*---
* This one was HARD! It didn't work like it said...
* Even though it should work, DON'T DO THIS!
*---
*blah: blah
*
and so forth.

CAUTION: The answers to a few of these are of the type of
"Who is buried in Grant's Tomb?" answer. It wouldn't be fun
without a few really easy ones.

As you will see, a few of these are going to require you to
get out an assembler ... I'm not yet enough of a "C" wizard to
pose assembly questions in "C".

All numbers in here are in Hex (base 16) and none of them are
trick questions. I've marked some questions "Oldtimers" that
apply to early ST developers (and, actually, a little before); if
you're newer than 1985 / 1986, you probably won't know these. The
people who have seen them won't forget them soon, "I betcha."
I've also tried to label the questions as to difficulty, sort of
like skiing runs are rated for difficulty. However, "OldTimers"
I'm going to assume hacked though the same stuff I did, so no
ratings there.

If you find out and answer these (I'll run answers in a
later column, Explaining All, once the Competition is over), you
will have learned some REALLY cool stuff, some of which is
extremely useful.

* *

The International ST/TT *Expert* Programming Competition
Programming & Related Questions
Copyright 1994, David M. Small

1. [OldTimers]:

Why is it a poor idea to use conditional assembly
with AS68?

(AS68 is an Atari development tool superceded by another
assembler). What *exactly* goes wrong? Why is this gruesome?

2. [OldTimers]:

Why is it a bad idea to do this in AS68:

```
;-----------------------------------------
; (previous code -- whatever, long as it's legal)
;
```

```
RTS
;---------------------
; Next routine has 2 entry points, with no opcodes on them.
;
VIDEOROUTINE
RELOOP
(routine code)
BRA RELOOP
; end of routine
;---------------------
```
What exactly goes wrong? Why is this grim?

3. [OldTimers]:

What GHASTLY thing will happen if you assemble an assembly language file named, oh, "DSMALL.S" (just some random name I picked out of nowhere), using AS68, like this:

```
AS68 -l DSMALL
```

4. [OldTimers]:

What happens if you try to LO68/RELMOD a file that doesn't exist? For instance, as part of a batch file to assemble, link, and RELMOD (change from CP/M-68K to TOS format) a file.

5. [POINTS FOR WITTY, ORIGINAL REPLIES]

Why do I not use AS68 nor LO68/RELMOD any more? (HINT: See 1-4)

6. [HARD ASSEMBLY QUESTION]

Assume these registers (data registers all equal corresponding address registers):

```
D0 = A0 = 12345678 A1 = 23456789 A2 = 34567890 A4 = 45678901
D5 = A5 = 56789012 A6 = 67890123
D7 = userA7= 00001234 supervisorA7 = 1235 Status Reg. = 2307
PC = $5000 (and is in a legal program, etc.)
```

You are in supervisor mode (e.g., SSP & current A7 = 1235).

You perform a multiply instruction using D0 and D1. (Any multiply, I don't care!)

WHY, exactly, do you get 3 instant bombs (yes, 3)? (Remember, we're at IPL 7, so interrupts are not distracting us.)

7. [HARD ASSEMBLY QUESTION]

Assume you MUST shut down RAM for a time (probably by writing some value into the Atari Memory Controller, the MCU). (Say, you're working on the 3 MB of RAM upgrade developed in Germany we had to tweak Spectre for -- those folks HAD to tweak the MCU.) Of

course, interrupts are off. Now, do a division. Will it work?
Why?

Once you figure out 6 & 7, "you're welcome". Believe me, I
wish I had known it too!

8. [HARD ASSEMBLY QUESTION]

How, exactly, can you "legally" (e.g., not by directly jumping
to the exception vector!) generate a "spurious interrupt" on the
ST-series hardware? NOTE: Atari assures me it is "impossible".

9. [HARD FLOPPY DISK CONTROLLER/DISK DRIVE QUESTION]

Many people are aware you can step the disk head past the 80th
track; some programs even use this to store data (shriek!). [Not
all drive will step past track 80]. However, what is NOT
generally known is that there ARE accessible tracks -1,-2, and -3
OUTSIDE of TRACK 00. (I have just told you a secret that will
have copy protection makers/breakers turning pale). How can you
consistently access tracks -1, -2, and -3, to either implement
copy protection or just store data?

[NOTE: This question does not apply to disk drive mechanisms
which really have a "Track 00 Stop" where the head is forced to
stop at 00; however, there are a bunch of drives out there that
go to -1, -2, and -3. In fact, I don't think I've seen a Track 00
mechanical "stop" on a 3.5" disk; they're common on 5 1/4"
disks.]

10. [HEAVY FLOPPY DISK CONTROLLER/DISK QUESTION]

Why is it a good idea to ALWAYS step outwards 5 times before
doing a RESTORE (seek to TRACK 0)? Note this is done on the ATR-
8000.

11. [HEAVY ASSEMBLY/C QUESTION]

Assume you are trying to write a Mac emulator (just to pick
something incredibly masochistic to do). Assume the Mac uses
memory from $100-$13f, and on up to $B00, for that matter) for
"Global Variables", which are often directly accessed by programs
(for instance, ol' "MemTop", the top of RAM, at $108).

Why does this spell *absolute disaster* for a Mac Emulator
on the ST hardware?

(HINT: It stopped me for a month! and almost, almost for
good).

12. When I solved it, it was the last "big" problem in
implementing a Mac emulator. I literally woke up with the
solution at 3 AM. Two months later Mac mode ran.
So: How'd I solve this problem?

13. [LIGHT ASSEMBLY QUESTION]

What does Test and Set (TAS opcode) do on an Atari ST? Why? Should it? (TAS is traditionally used to implement kernal operations on multi-tasking, multi-CPU machines).

14. [EXTREMELY HEAVY ASSEMBLY QUESTION]

Assume you are working with a program that generates Nil pointers (in other words, address registers that equal zero, 0.) The programs write to this address. On the ST, that's writing to ROM, and you bus-error. Assume the registers are all in valid RAM (except, probably, the one that's pointing to 0.)

How can you then RECOVER from the bus error, given that Motorola's 68000 books say you can't, and keep going? (Motorola says you need a 68010 to recover, and to implement Virtual Memory, as the 68000 buserr stack frame doesn't have enough data.)

Assume that data written to a Nil pointer is unimportant, because the program should not be doing that anyway! -- the data is unrecoverable.

HINT: Look at a bus error stack frame.

NOTE: About 1/3 of Mac programs do this; we help Mac Developers Beta-Test just by seeing if they "Nil-Pointer" and try to crash the Spectre by writing to 0. Frankly, until I solved this problem, they would crash the Mac emulator; when it was solved was the beginnings of major success for Mac Emulation. That's when the "biggie" programs went stable.

15. [FUNNY ASSEMBLY QUESTION]

Does Atari's TOS *ever* access location 0 because of a Nil Pointer? Pick any version of TOS. Show the statement & address. Please, no printouts over 10 pages long.

16. [TT USER QUESTION; ASSEMBLY/C ANSWER]

Why does having TT RAM (or equivalent) in the TT (or equivalent 68030 accelerated) machine end up usually accelerating the TT about 11% (depends a little on what you're doing), *provided* the RAM is there AT STARTUP?

17. [EXTREMELY HEAVY HARDWARE/SOFTWARE QUESTION]

You need to startup a 68030 with the first 68030 compatible TOS, TOS 1.62, to begin to debug a 68030 board. The TOS chips are plugged in through the Mega ST bus connector and a PAL address decoder (thus allowing all 256K of ROM to be accessed) and are properly mapped at $00E00000 (by the way, the 24-bit address has nothing to do with this question!) The old TOS 1.4 chips are removed.

Trouble is, you're doing this on a *Mega-ST*, and TOS 1.62 is for *STE* machines, with their added video/sound registers. When you try to startup, you crash, as TOS initializes video/sound registers that *don't exist on a Mega-ST* and bus-errors out (no DTACK/DSACK generated since "that location don't exist" to the GLUE/Shifter chips).

WITHOUT MODIFYING THOSE TOS ROMS, (like, NOP'ing out the inconvenient MOVE's) and without some big fancy PAL disabling certain ROM addresses, how can you get around this stuff in startup and in the VBLANK (vertical blank) code (where, of course, the low byte of the video address is updated if you changed the register for it).

In other words, I'm asking you how to run ROM code and change the path of execution in "firm"ware.

ANSWER NOT ALLOWED: "This is impossible. That's why it's ROM."

ANSWER NOT ALLOWED: No, you can't use the 68030 MMU to copy the ROMs and move RAM under it; this technique doesn't require anything so sneaky. It require sneakier.

NOTE: This is an EXTREMELY valuable technique to know.

18. [MEDIUM HARDWARE QUESTION]

What *usually* happens if you directly switch on video? In other words, do a MOVE right into the hardware location that has the display mode (low, medium, high rez) to turn the screen on. (Something like, MOVE.B, #2,hwdisp_mode ; kick on mono)

HINT: "Two men looked out _____ "
"One saw the mud, one saw the stars."

19. [MEDIUM HARDWARE QUESTION]

What's probably going wrong in what happens in question 18?

20. [MEDIUM HARDWARE QUESTION]

What does "ST" stand for officially, and what does it have to do with question 18?

21. [MEDIUM SOFTWARE QUESTION]

What's the solution to 18? How can you kick video on yourself?

22. [LIGHT HARDWARE QUESTION]

Assume you are running on a TT. The cartridge you have in there (let's stay away from Spectre so you don't think it's related ... say, some video digitizer cartridge, .. well, the cartridge suddenly fails with a gruesome direct short circuit. You sensibly turn the TT off and remove the cartridge. You

replace it with a new cartridge. The TT has (at best) difficulty using the new cartridge, to say the least! (It probably won't work at all.)

ASSUME that the ROM-decode, read, PAL logic, and all that stuff, was not damaged.

What's wrong? And why is this something EVERY TT owner should know? (I believe it applies to Mega-STE's as well).

23. [HEAVY HARDWARE QUESTION]

What did Atari NOT keep constant between the ST and TT cartridge timing? Why does this foul up cartridges?

24. [HEAVY SOFTWARE/HARDWARE QUESTION]

Certain Atari chips *must not* be accessed too quickly. For example, the Zilog 8530 serial chip (runs 2 9-pin ports on the TT and the Localtalk-size-compatible connector) cannot be written to faster than 2.2 microseconds per write. Since the TT is smoking... errr, zooming along at 33 Mhz (33 cycles/microsec), it would be easy to write again too quickly, overrun and zonk out the SCC. (The same thing applies to writing to the ACSI "disk chips".)

What's the documented, sorta "official" way of assuring a "slow", 125 nanosecond or "8 Mhz" cycle to provide an *enforced slowdown* for the SCC and disk chips on a faster machine, like an accelerator or TT?

25. [HEAVY HARDWARE QUESTION]

What happens when you try that assured, guarenteed 8 Mhz cycle technique on a TT machine?

26. [HEAVY SOFTWARE/HARDWARE QUESTION]

Assume you're using the ST Atari's mouse with your own driver for it (like, say, some emulator might .. *grin*). The mouse moves. Assume a byte comes in from the mouse. Assume the processor is busy doing an IPL=7 task (that means, all interrupts are disabled, like when reading a Mac disk with Spectre GCR). Assume this continues long enough for the next byte to come in (after all, mouse movements are transmitted in 3 byte packets, containing button, change X, change Y information). Then the IPL=7 task is done and the normal ST Interrupt Priority Level,3 is set. (The mouse has IPL 6 via the MFP chip, as the manuals say).

Why have your keyboard and mouse just locked up? What is the ESSENTIAL thing wrong?

What's a fairly good way of fixing this in your mouse handler? (I call mine "QuickMouse", by the way.)

27. [HARD SOFTWARE/HARDWARE QUESTION]

What is a *working* method of shutting down the keyboard and mouse, then waking them back up, so that the keyboard buffer and mouse don't overrun? As you can see from #26, this could be necessary for extended work at IPL=7 (no interrupts whatsoever). NOTE: By *working*, I mean it really works, not what some manual says.

28. [REALLY HEAVY HARDWARE/SOFTWARE QUESTION]

Well, if you're smart enough to get 27, how do you do it so it works on BOTH the ST and the TT?

29. [OldTimer] [REALLY EASY SOFTWARE QUESTION ... if you know.]

What did the "bombs" of the crash mechanism look like in the pre-TOS-ROMs version of TOS (that booted up off disk)? (HINT: I want to give you an easy question!)

29. [HARD FLOPPY DISK HARDWARE/SOFTWARE QUESTION]

What precisely is the bug that cuts the floppy disk drive datarate capability to drop by half in most ST's (Atari corrected this after TOS 1.4, I believe ... might have been TOS 3. Yet another reason to get a 2.06 card; your floppies will work faster!)

30. [HARD FLOPPY DISK HARDWARE/SOFTWARE QUESTION]

How precisely does Twister (published in the USA in START magazine, has since become at least an option on most "disk format" programs) work to max-out the data rate to/from Floppy? HINT: It fixes problem 25 by changing the disk layout. (This isn't so hard -- when it was published, we gave out the SOURCE CODE; Twister is the basis for the Meg-a-Minute backup to floppy program. The best you can get from floppies is about 1 meg per minute.

31. [HARD FLOPPY DISK HARDWARE QUESTION]

Why should you definitely wait 30 milliseconds after a step before beginning to write to disk? What are the consequences if you don't?

32. [OldTimers]:

CP/M-68K had a debugger. It could not disassemble one very popular opcode (especially in interrupt code!!). I saw this on a machine called Dimension 68000, which ran CP/M-68K. It was passed on to AtariFolk as a debugger, and still had the bug. It was finally fixed. What was the opcode?

33. [Humans / Electrical Engineering-Hobbyists]:

What is the A.C. voltage on the heat-sink of the power supply found inside the Mega ST's? Measure against, say, board Ground. Be sure meter scale is on multiple hundreds of volts!

(CAUTION WHILE MEASURING!!!, REALLY!!!)

34. [Humans/Don't Try This!]:

How far will you be thrown if you brush your hand against that heat sink? (Please convert kilometers to miles.)

[POINTS FOR ORIGINAL, FUNNY REPLIES]

35. [Humans/Don't Try This!]:

How many days will your arm and chest muscles ache after brushing your hand against this heat sink? (Please convert months to days).

[POINTS FOR ORIGINAL, FUNNY REPLIES]

36. [Humans/Don't Try This!]:

How many days will it take before your hair stops looking like "Young Einstein"'s hair?

[POINTS FOR ORIGINAL, FUNNY REPLIES]

37. [Overseas Travellers, EASY]

Summarize quickly the major difference between US and UK, French, German, and Swedish keyboards.

38. [HARD HARDWARE/SOFTWARE QUESTION]

What is the exact bug, and when was it fixed, in serial (modem) handshaking?

39. [HISTORICAL: Easy SOFTWARE QUESTION]

Which TOS fixed the interminable delay on saving a file if your disk was getting full?

40. [HISTORICAL: Easy SOFTWARE QUESTION]

Who rewrote the Disk Operating System section of TOS to do this?

41. [HISTORICAL: Easy SOFTWARE QUESTION]

Okay, who wrote it in the slow way to begin with?

HINT: Usenet users have an advantage on these questions as The History of TOS was given out there.

42. [VERY, VERY, HARD SOFTWARE QUESTION]

How many birthdays are celebrated in Spectre GCR 3.0 upon startup?

43. [VERY, VERY, HARD SOFTWARE QUESTION]

How many different quotes are randomly selected from in Spectre GCR 3.0 (if it's not a birthday) upon startup?

44. [MEDIUM SOFTWARE QUESTION]

What was one major anti-piracy protection placed on the Spectre 1.51 release disk?

45. [MEDIUM SOFTWARE QUESTION]

Why was this protection so hilarious?

46. [TRIVIA QUESTION]

Why didn't the "Alarm Clock" work for SO LONG in Spectre?

47. [TRIVIA QUESTION]

Name all the releases of Spectre. How many are there that made it out into the world? Include Spectre 128 and Spectre GCR.

48. [TRIVIA QUESTION]

What was the sound in the hidden dedication page of Spectre 1.51?

49. [HARDER TRIVIA QUESTION]

What was the updated sound made available to Spectre users, with the advice it was wind-chimes and hard to hear, so they'd better turn it up?

50. [Awww, Heck, Give 'em a point]

Who's buried in Grant's Tomb?

* *

There you are, an expert-level quiz on the Atari. Given time, I could think of some really obscure questions (why doesn't a 5 1/4" drive always work when you plug it in, or, what is the termination situation on the floppy bus?), but I think 50 questions is enough to seperate the Hackers from ... the general populace.

Best of luck, I promise there ARE answers, and I hope this brings back a few memories, too!

See you next time, and I hope you had some fun!

I was unable to get any games to work except for Battlezone (cbzone10.zip).

But I was able to get the gogo dancer working in the monochrome mode ;)

Anybody else have any luck getting any games to run?

Is it possible to access Maus newsgroups through the Internet?
I'd like to subscribe to a few, especially the Atari ones, but my
Internet provider needs to know the names of them first.
Can someone supply me with a list of the Maus groups available?
Thanks.

Hallvard

Well, you have some alternatives. If you want to use some dedicated ST mouse, I recommend the Golden Image / Jin Mouse model. It's fast and accurate, and pretty durable too. LogiMouse Pilot is good, too. If I were you, I'd hide the original Atari mouse immediately - it's not a good design. But you can also use some good PC serial mouse, with certain software. I believe, some PD software makes this possible, as does some commercial package (does anyone remember the names?). The pen-mouse they sell in England (at least 2 models) seems very interesting, too.

353. Falcon accelerators

Newsgroup: comp.sys.atari.st
Date: 1995-04-08 00:00:00 UTC
From: gs01tph@panther.Gsu.EDU
Message-ID: <3m6mup$g3u@sphinx.Gsu.EDU>
Source record: 168026

I'd like to know something about BARRACUDA 040 accelerator:

- The estimated price (basic and extra models)
- Does B. increase Falcon's bus speed as Screen Resolution Card does?
- Does B. disturb DSP ?
- Can one use Falcon's normal FPU with B. ?
- How does BACKWARDS ST-emulator tolerate B. (very important!) ?
- Some GEMBENCH results..?
- Games compatibility (you WIZards out there; will Formula One GP run ;-) ?
- Problems: Calamus SL / Papyrus Gold / DA's Vector / Outside 3.2 ..?
- What will happen to the original Falcon graphics, after installing the graphics card add-on to Barracuda? Do demos and games still run, or are we in a similar situation to TT's or ST's graphics cards (only VGA modes) ?
- Some facts about the 486DX card (speed, graphics, sound, etc.) ?
- What to expect: to whom is Barracuda a real alternative, and to whom it isn't a wise purchase (due to problems, for example) ? Can I expect to live a "normal" life with Barracudized Falcon, using the same programs as before - only much faster..?

Thank you beforehand, whoever knows..!

BTW, the manufacturers of Barracuda: please, don't price your apparently great product too high. The Falcon is an expensive computer to upgrade, because of the often necessary new casing, RAM boards, etc. The total sum easily becomes too high for most people. PC towers aren't very expensive themselves - neither are PC graphics cards. For Atari computers, they both are. To become an attractive alternative to PCs and Macs, there should be a way to upgrade ones Falcon or other Atari model to 68040 and tower case _without_ spendind $1000..$3000..!

I feel that somebody tries to "make money" by asking horrible prices from pretty simple and not-too-well-made things like DeskTopper for Falcon, or especially the graphics cards. But this won't work: most Falcon owners realize that they pay too much - and refuse to make the purchase. Does anyone know how many Atari dealers, or third-hand program or hardware makers have thought that they can ask 100..300% more money from something, just because it is for ATARI - and failed, going out of the business? Because even if people use rare computers like Falcon, that doesn't yet mean they're stupid. Or desperate..

So, I wait for Barracuda eagerly. So do many others, I think. But if the price will be (what I fear it will..) unrealistic, and far above the prices of 486 Overdrive cards for PCs, etc. - then I won't think about Barracuda - no matter how much I like my Falcon. 68040 may be new, and powerful for Atari world - but the rest of the world is already going with Pentiums and Power PCs. And 040 already is a standard in Macintosh

computers. So, please: no extra Atari-owner taxes this time?

What about the "power without the price", anyway?

If someone else there DOES agree with me, please speak out. Because otherwise we may face another overpriced product that doesn't help anyone anywhere..! Most Falcon accelerators are far overpriced =-(

Opinions?

You think Apple is more alive than Atari? Don't be so naï¿½ve.

BH>Where from?

GE-Soft. The 040 version will be coming - the problem was a chip Motorola doesn't produce anymore. So they invented an according custom chip. And since the 030 version already works at the speed of an 040 because of the intelligent concept, you may wonder how fast the 040 version will be. And last but not least - the Eagle has got a processor /card,/ so that you may replace the 030 or 040 (however) by an Intel or a PowerPC; the only thing you need is a suitable ROM.

DS>for the mac?

Of course. MagiCMac. But I wouldn't suggest you to buy it. In my opinion, it's slow and little compatible. Especially to a previous 520 owner, who had few problems with compatibility, there are only /very/ few programs that will still run - however, it can be a good feeling to know that you haven't trashed everything in tragically selling an Atari. :-)

Message-ID: <D6r6u4.AEz@cunews.carleton.ca>
Source record: 168032
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have just set up a minix partition for mint (compiled for hardware
scrolling on the Falcon:) and am trying to use tcsh (605).
Could some kind soul out there tell me what I have to do to get tcsh
to read a .tcshrc file?

If you don't feel like explaining it to me I would be very happy to have
your partition file Iisting and mint.cnf etc. files.

It also seems that the install program from the Mint Distribution kit
does not work on my Falcon: wheneve I try to read a *.sys file from a floppy
I get some GEM window telling me : a file with that name already exists or
the file is set to read-only.

any help would be greatly appreciated

You mean copy-protected? No, forget it!

Most games will not work because they access video and sound hardware registers directly - they are not available on Macs and cannot be emulated either.

To try out, get the MagiCMac Demo from somewhere (use the mac-program anarchie to search for "magicmac"). E.g., you can get it via ftp from "pascal.zedat.fu-berlin.de" in /mac/demo/

363. HELP!!! ST in the recording studio

Newsgroup: comp.sys.atari.st
Date: 1995-04-09 00:00:00 UTC
From: mcwilliams@wmich.edu
Message-ID: <1995Apr9.003004.30197@wmichgw>
Source record: 168036

Ok, you technical minded ST owners, I was using a 1040st for the longest time in a home studio and have recently purchased a used Mega 2 with 4 megs of memory. I have the following problems/questions:

1) Can putting the monitor between two speakers (they're about 4 1/2 feet apart) harm the monitor? I've noticed a bend develope on the edge of the screen image but am not sure if it's related to the placement of the monitor.

2) The 1040st and 1040STE don't have fans. Can't I disable the fan on the Mega? If not, what's the difference between the machines? Would putting the cpu in a sound proof enclosure harm it in any way?

3) Simply turning the monitor, and especially the computer on, adds line noise to the mix. I've tried using an outlet strip that filters noise but it doesn't seem to do any good. Is there any other way to eliminate this problem?

Thanks,

Brian

[...]

This is NOT a message from the operating system!
Sometimes it can happen, that the GEMDOS pool is full. But in this
case you get the message

*** OUT OF INTERNAL MEMORY:
*** USE FOLDR100.PRG TO GET MORE.
*** SYSTEM HALTED ***

And nothing else! If your problem is caused by a virus - wich programs
do you use? Did you compare file-sizes and -dates from your original
disks with the current programs you are using?

Ciao...

L>to convert these files to asci or anything readable on my Atari
L>available on the net?

Unfortunately, you cannot convert PostScript files to ASCII files or the like. PostScript is a page description language, which allows you to describe any kind of graphics or text. If you want to render PostScript pages, use GhostScript. The actual version is 3.12, it is fully implemented into GEM, can render up to 24bit resolution, and is very easy to handle.

The only thing you need to regard is that the output will be a bit image. Depending on the output resolution, you will need a lot of memory. But that cannot be changed - PostScript is a real memory hog.

Contact timg@landau.ph.utexas.edu (Tim Gallivan) in order to get more to know.

KA>Nope, if i can't use my Falcon for anything, my next choice is a Pc.

Well, that would truely be a /very/ bad choice. But still, you /can/ use your Falcon for something. And I do not confirm that MagiC is a very excellent choice. With Geneva (which runs with or without MiNT), you have quite more comfort and speed. Regarding all its incompatibilities, MagiC truely cannot be said to be the only thing which stops you of buying a PC.

Cheapest will be System Solutions in the Uk. Their Translator isn't
bad. Next best is the ICD Link for which you can shop around (look
out for Atari World - it's full of ads <g>).

Avoid the Gasteiner one - the build quality is suspect, not to
mention the apalling software.

You need to give more information than that!

1. What are you doing, when you get the message? What program are you
using? -It could be true, that you really ARE out of memory. Even though
your computer has 4 megs, some BIG programs can run out of it.

2. Have you checked your disks for viruses with a virus-killer?

3. Have you checked the memory? -It _could_ be a fault within your
RAM-chips...

4.... etc. etc.

-With regards...
Hrafnkell Freyr Hlodversson

If you're not using MintOS for logging in, it is a good idea to set the
HOME variable in your mint.cnf file. Tcsh (the version I use anyway) will
look for both cshrc.csh and tcshrc.csh in that directory.

> Hi, can anyone recommend a good hard drive defragmenter...

I use Michtron's Hard Drive Turbo kit. This lets you configure your HD partitions to "mostly read" or "mostly write". So if like me you have your programs in one partition and data in another, it's very useful. I haven't seen it advertised for sometime, so you might have to look long and hard for it. Then again, I've heard good things about Hisoft's DiamondBack/DiamondEdge programs - I just don't see the need to upgrade just yet.

It *IS* possible, and 4 meg for you is probably somewhat expensive. Not
having the possibility of simms.

> You have to install MiNT, MiNT-NET, X11 for MiNT and all the network
> utilities. Then you could make a PPP/SLIP connection between the Atari
> and (I presume) your PC, set the DISPLAY environment variable to your
> Atari Display and get the ting on the road. (I tested this, It works).
> You can find all the files at the atari archive or its mirrors...
It is a bit tricky though. You should do everything to preserve memory.
This is what I do on my MegaST 2:
Mint is started with a simple shell (about 100K)
pppd/chat is started to make network connection
kill -9 of pppd id (you have to use -9 else the connection will be closed)
a shell script which:
starts X server
sleeps for a while
exec rsh to computer with X clients

As you see it's a true Xterminal, everything runs remote. This way you can
add some memory to the X server stack which is nice if you want to install
some extra fonts. I've got problems running xmodmap local, it complains
about a bad socket or something, so I do it remote. The same problems shows
with xhost so I use the .Xauthority/xauth stuff. There is a little problem
bacause I can't run chimera remote, I'm not sure why... Well that's about it.

> If you have any questions left, you can email me.
And me ofcourse...

Gerco.

PS: And for the guru's: How do you get a bell and/or keyrepeat under X,
both the Xserver options as the xset don't seem to work.

Most modern SCSI drives have their spects set internal and should
tell the ICD software how to format the disks...

Mind you the disks could allready be formated, try and format a Quantum
drive, you can't, all you can do is to partition it...

Most modern drives are now formated at the Factory and you can't format them
your self...

I strongly advise against using SIMMS from an ST in a Falcon - the Falcon needs 70nS or better SIMMs where as most used on the ST are the older slower ones. Using a mix of different speed SIMMS is also a no no as the slower chips take longer to refresh and this can cause the faster SIMMS to burn out.

> v2.01 not supported" message, or somesuch, when I attempt to
> load the images).

There is no such animal as JFIF revision 2.01, and probably never
will be. 1.02 is the current version. Unfortunately, one release
of the PC program Hijaak Pro got the version bytes backwards and
is writing 0201 where it should be 0102.

Gem-view is doing the right thing by rejecting the file -- if there
ever *were* a version 2.xx of JFIF, it would be numbered that way
because it was incompatible with present software. That's how the
spec defines the major and minor version numbers. 99.9% of existing
JPEG readers will reject these files. Apparently Hijaak's QA department
doesn't bother to cross-test with other software before they release
code.

If you have a binary-file editor, you can fix the problem by
changing the twelfth and thirteenth bytes of the file from
02,01 to 01,02.

>included in the Pro Utilities, since they came out before the drive

If the ZIPper behaves like a correct SCSI-device the normal usage shouldn't be
a problem at all.

Special features, e. g. enabling/disabling of cache, auto-park/shutdown,
software selection of the ID and this sorta stuff are more or less vendor
specific and might not be supported by _any_ software.

And I have my doubts, that this drive will play a major role in the
Atari-world, and therefore it might be unlikely to see the arrival of
special versions of e. g. HDDRIVER or HuSHI.

Bye.

I agree with that... It would also be a very good idea to develop
a PPP driver that do not require a huge knowledge in TCP/IP protocol
and Unix-like softwares. Something like what exists on Mac, for example.
I have NOS but could not make it work for the moment. Maybe I'm a bit
stupid... but I think other people might have the same problems...

From: jack@aurora.carleton.ca
Message-ID: <D6sD5G.Mns@cunews.carleton.ca>
Source record: 168072

I set up some minix fs partitions under linux for the Falcon (using the
kernel from zippy) but I was unable to exrtact root.tar on my partition.
tar -t root.tar doesn't do anything either: it just sit there untill you press
^c
When I do the same under mint everything works OK

BTW if anyone else has the correct configuration on their Falcon (14MB+FPU)
and is looking for help to get started please let me know. It would be nice
if we could get some discussions going.
Anyway, I heartily recommend you try the kernel from zippy (there is a copy
of it on ftp.cnam.fr in /pub/Atari/Linux?). Everything seems to work like
a charm. All my IDE and SCSI partitions are recognized correctly and
you can use Blowup030 in any rez as well as NVDI 2.5. I haven't ahd any
problems with my SCSI drive either. The only problem is I'm going to have to
dedicate my whole 130MB SCSI drive to Linux now :).

I've had this working too (though with a TT rather than a MST2). However you *will* need more memory. My 2.5Mb STM is very tight on memory just with the MiNT and MiNT-NET stuff. I'm pretty sure the X server would be too big for it.

You'll also need a fair chunk of disk space - and a serial port mod to get to 38400 (assuming your PC can do that (16550a)) is also pretty handy. Works usefully at 19200 though.

Having said that it does work rather well.

:-)

: >And there are a considerably number of Falcon-owners now! And everbody I know that owns a Falcon, want MagiC 3 now!
: >And I wan't MagiC 3 for my Falcon too! Why the h*ll support ye olde ST and not the Falcon ???? That's VERY STUPID!!!!!

I think the reason is that development of Mag!X began when the Falcon was only a glint in someone's eye...

Anyway, poor people like myself wh cannot afford to buy and run a Falcon (but would otherwise dearly love one) are VERY glad that MagiC will run on their ST's.

Anyway, at the mo' I would say that a vastly upgraded ST (i.e. accelerator, memory, video card etc.) running MagiC is more desirable than a Falcon running TOS (or even MinT/MultiTOS).

From: andrew@minster.york.ac.uk
Message-ID: <797524356.1@cs.york.ac.uk>
Source record: 167857

Has anyone, or is anyone producing a DSP modem for the Atari Falcon? I've
got the C source code for such beast and I'm about to port it to the Falcon.

Before I do, I thought I'd find out if someone else has done it.

BTW. I'm not sure if the DSP will be fast enough to generate the modem
sounds but I'll try. The modem can only go up to 1200 baud so don't get
too excited. I think it will manage to send and receive faxes too.

The POV editor was released on a cover disk of ST Magazine (French mag). I believe it was a beta version or something and it needed 640x400 resolution to run.

It's now available on ftp.cnam.fr /pub/Atari/Graphics

Hope this helps

Nick

They don't work together. NVDI is faster at most operations than W9, and includes GDOS, so you'll use NVDI most of the time.

It will cost no more to buy the newer version than to upgrade. But as an owner of both NVDI 3.01 and 3.02, I'd say the difference is too minor to worry about, unless you are bothered by the text problem in Atari Works, which 3.02 sorta-kinda fixes (if you switch one standard NVDI setting off when running Works).

You can buy 3.02 from Toad. e-mail to toad@charm.net.

: sampling stuff onto their harddisks 'til they blew up.

Interesting! I always thought that this was a bug specific to TOS 4.0
since I never saw it on my TT or the STs (although I have some code
in my driver to alert the user if such a thing happens, so it should
be very obvious to see then).

BTW, if one of you out there should be bitten by this bug, DON'T PANIC.
It's only the bootsector of one partition which is seriously wrecked,
and bootsectors are *much* easier to repair than most people think.
You just need a disk monitor which can read/write absolute blocks from your
hard disk and the following information:

- Partition start sector (can be found in the root sector)
- Partition size (also in the root sector)

It is, Hutch, it is. The hardware is merely the same, the II-commandset has
some more possibilities. IIRC, all the audio-commands on a CD-ROM are SCSI-II.

Some Atari-hostadaptors do not support sending II-commands. ICS introduced a
certain "hack" to enable just that.

No dumb questions, only dumb answers ;-)

Take a look at this:

------------------------------cuthereplease------------------------------

Linux 68/k CD (available May 95)

(ALD - Atari Linux Distribution): Original Developer Distribution!

Incl. Base-System, Kernel, Sources, Binaries, X11(X-Windows!) in
monochrome and colour!, Unix-TeX, Network-Tools(TCP/IP), Emacs, Gcc,
G++, TOS-Cross-Compiler, DLL-Development, Objective C, Perl, etc.

200 MB on the CD

------------------------------cuthereplease------------------------------

ATM, I am not sure if this is X11- R5 or -R6, but I can find out if you want
to.

From: soltech@sentex.net
Message-ID: <3mblb4$6sl@granite.sentex.net>
Source record: 167871

Is there a TCP/IP stack, similar in nature to the Trumpet Winsock for Microsoft Windows, available for the Atari ST, in the native GEM or TOS environment. It should be able to do a Slip or PPP dialup to a service provider. We're not looking for any of the Mint/MultiTOS/Geneva, etc, versions of such a product, just a simple GEM/TOS based program.

If there is source code available for such a beast, we'd be interested in hearing where we can pick it up. Also, any pointers on where one can get a POP mail reader and a simple, text based WWW browser??

Thanx in advance for any help!

From: ljord@algonet.se
Message-ID: <3mbqli$57d@aristotle.algonet.se>
Source record: 167872

I just got myself a second IDE hard disk
for my Falcon. I have some problems installing
it though.
I'm using SCSI-tools with HuSHI ver 5.10 maybe
there is a newer?
My manual tells me that SCSI-tools do not
support IDE, but the program does. I have one
disk installet already. I can partition the
second IDE but not install it.
My hard-disks are CONNOR CFS 210A running,
CONNOR CFA 340S (scsi disk) and the new
CFS 540A.
Do anybody have any suggestions?
Are there any other hard disk programs?
What are the newest version of AHDI?
Can I get something usefull on the Net?

Thank You!

Reine Jonsson

]>damage my machine at all, but I'm not saying it won't!

] This is a VERY STUPID WAY TO DO THIS, thier is a very simple way...
]
] Get hold of DC Formator 3.3 I think it is, there is a option to make floppy
] bootable boot sectors, select the one listed as BYPASS HARD DRIVE, and write
] this to a floppy...
]
] Also have on this floppy disk a copy of the Hard Disk booter, I have the ICD
] one in the Auto folder and Drive Icon C: saved on this disk, Desktop.inf
] file..
]
] Its that simple...

Thankyou for your kind words regarding my suggestion, Roger. However, when the computer is inoperable because it won't run *anything* before it crashes, you can't get DC Formatter, and stick it on a floppy disk and run it and..... In my case, the computer wouldn't respond to anything else, hence my slightly risky action.

I've got a mail which explains how to get MagiC *3* running on the Falcon
without patching it. It's just a matter of configuration and of course, the
Falcon-specific hardware (sound system, DSP) is not supported. Everything
else is OK -- the mail says.

Is anyone interested in a translation? ;-)

>And i've also been informed that it has problems with external harddrives on
>the Falcon.

IMHO internal IDE drives because MagiC 2 didn't have any inbuilt IDE support.

: Recentley my G:-partition (60MB on SCSI-2) ran full. I copied a file bigger
: then the space left on the G:-partition on it. The next thing I know is that
: my H:-partition (60MB on SCSI-2) is not accesible anymore. THE FILE WAS
: WRITTING OVER THE FAT'S OF THE H:-PARTITION?. All of my data on H: is lost.

no it was not lost !
a sector to change and everything would have been ok

: to my G:-partition and AGAIN my h:-partition is no longer accessible !
: I got realy frustrated and started to backup the rest of my SCSI-2 (120MB left)
: to my internal 80MB IDE. I didn't look at the space left on my D:-partition
: (+/- 30MB on IDE). I wrote a file there that was greater than the space left
: (I think) , result : E:-partition (+/- 30 MB IDE) not accessible anymore !!

: WHAT is doing this. I use a Falcon 030, 80MB IDE , 240MB SCSI-2, tos 4.04
: AHDI 6.01. It happend the first time running Multitos and the second time
: with only blowup and NVDI 2.5 active (no multitos or plain MiNT).

something similar happened to me several times, but never while
copying files with the desktop...

but generally, all the data is not lost: only the first sector
of the partition gets corrupted, and if all your partitions have
got the same size, it is possible to copy the first sector of
another partition (except the partition that corresponds physically
to the hard drive) into the first sector of the disappeared partition
and the problem is then solved

I've done that with a little program using a Gemdos or (X)Bios function
in fact I think that's the Bios 4 but Im not very sure...
I give as the number of the partition that's before the missing one
and as the sector something like the number of sectors
of this partition + 1. (I'm sorry I can't tell you exactly, because I
haven't got my falcon here, but it works well in fact...)

But it's true that I never saw a program able to do that automatically

(but some of them are very useful to know the number of sectors...)

I hope this can help...

FFX.

448. Linux on TT, How?

Newsgroup: comp.sys.atari.st

Ok, I'm shure this has probably been done to death.... But, I'm new here and am trying to get Linux (and then Xwindows followed by an xwindows www browser) going.

1) What FAQ's where should I read.
2) I've DL'd the latest Linux kernel & booter.

At this point, I run the booter and read that the startup & boot? (Sorry didn't wright down the actual message) are going to occupy the same space. Back to TOS I go.

I may have missed a step in the setup somewhere, but I can't find it.

For those who may ask, Its a 4 meg 80 TT. Will be using external Syquest as my Unix partition.

Much thanks for any help.

This is correct - though there is a switch in 'minint' to allow longer
names.

Wow - *feel* the code quality! ;-)

Whats it like - and are there any bits it was unhappy with? Also does the
FPU code work?

Thanks

:-)

Roland.

454. MintNET/PPP connections ....

Newsgroup: comp.sys.atari.st
Date: 1995-04-10 00:00:00 UTC
From: mbaffoni@skat.usc.edu
Message-ID: <3mar1l$eb3@skat.usc.edu>
Source record: 167889

I just joined my fellow masochists in trying to get a PPP connection
(with MintNET-070) going.

First, I'm not sure if I can - reading through the docs, it is assumed
that you have been given an IP address, or rather a static IP address. The
way it is done here, you go into a PPP account, and then you are dynamically
assigned an IP number. Is that a standard PPP transaction? If so, does
the .xif that comes with minNET-070 support dyanmically setting the IP? (BTW,
the IP assignment is in binary, not text format - I can't read anything after
I put in my PPP acount password - the queries from the PPP server must start
at that point because it is a binary mess).

BTW, I must say the installation instructions are difficult to follow
at best. There is no one file that says proceed from step 1 to 100 and you
will have a slip/ppp connection. It would help if there was one document
or maybe mone document per connection type (slip, ppp, oslip, enet, etc.).

Also, it would be real nice to have the connection software more
user friendly - maybe a Gem program that has windows where you put in the
right information (local IP, hostname, port, etc.), and perhaps a simple
terminal window with the ability to learn your actions (save into a real
simple script file). That way the user need only go to one area to setup the
actual connection. I'm sure someone is working on making the installation
easier so I won't start on that. :-)

Thanks for listening, and maybe someone can help!

> >and there are more Falcon-owners than TT-owners.
>
> THAT I doubt _very_ much.

Sorry, I meant that the TT isn't being produced anymore.

AND I still mean that there are more Falcon-owners than TT-owners, that should be very obvious since the price tag has always been VERY high for the TT, the Falcon was (when it came out) priced at a reasonable price.

But anyway I just heard that MagiC 3 IS coming for the Falcon, 2xBehne is just optimizing some features and implementing some DSP routines.
The reason why they released the ST/TT-version of MagiC 3, was because of pressure from Application Systems Heidelberg who distributes MagiC. And 2xBehne wasn't very happy about releasing ST/TT MagiC before the Falcon-part was ready.

Keep Cool and Flying...

: > c> know that there are lots of editors available for the pc.)

I found it, I think... A French program: eb_edpov is the name of the package. I think it was in ftp.cnam.fr, or ftp.uni-kl.de. Not sure :-(Alhough I don't understand French, and there are no readme files included, I'm pretty certain this is the program. It's big, comes with loads of example files, and claims to work on everything from STs to Falcon (this I found out investigating the HUGE resource file..).

Well, since I'm stuck with a PC here where I study, I haven't been able to try what the program exactly does. But: go and get it, folks - and tell the others if the thing works =-) !

You're getting some RF interference from the computer. If I have my TT on
and try to watch TV using an antenna I have to peer through a lot of
snow... you're getting the same effect.
I don't know what to tell you about fixing it though...

458. Re: MagicMac and protected games

Newsgroup: comp.sys.atari.st
Date: 1995-04-10 00:00:00 UTC
From: dsmall@well.sf.ca.us
Message-ID: <3ma4pn$au0@nkosi.well.com>
Source record: 167893

[re: MagicMac not running games because they "hit on" Atari ST h/w locs]

That's a shame. With a 68030 or 68040 (I don't know about PowerPC),
you could program the MMU to interrupt out whenever anything in the $Fx xxxx
address range is it, decode the "hit", and emulate it. For instance,
if they're writing a byte to the shifter_mode, change resolution. There
would be speed problems in some areas (like software overscan) but that's
hopeless anyway.

This is very close to how the "zerostore" code in the Spectre works.
It decodes the address being bapped that generated the bus error. If it's
0, not much happens; if it's the special "debug card" address, we do
something; if it's a "global low mem vectors" loc, we do something else.
Only difference is we didn't have a MMU running point for us, so we had
to work with the data on the crash's stack frame (the IW was the
opcode that killed it, and we had to translate that (disassemble it) to
find its length, and some special stuff.

For example, some MacPrograms do a MOVE.L #"Nil!",0
so that if they have Nil pointers, the "Nil!" gets stepped on, and
they see it. Amigas have long had a zerostore watcher utility.

Anyway, MagicMac is pretty impressive in the number of TOS things
(especially VDI) they must emulate to make it work. (I wonder if they
fixed some bugs -- say, slow v_gtext, or normalized x/y not working).
Spectre GCR never ran "MegaRoids" (an Asteroids clone), either, so I
know how they feel. (Nor Dark Castle. nuts.) But it ran enough to be
useful, and that's the point.

[Question is, what to do about Mac files on an HFS partition, since
Transverter from Doug Wheeler only handles MFS.]

There is no higher version #. You have the latest.

There were programs MacSee and MacRead being sold awhile back
which read/wrote HFS partitions from GEM. However, there were many reports
of glitches. My opinion is that, as the ad says, "50% of Mac directories
contain damage" and numerous bug reports from Norton Utilities on Macs
I help maintain at school in the directory area, that possible the problem
was not in MacRead/MacSee -- that they were trying to work with a glitched
directory. I'd strongly recommend you go into Mac mode and Norton-"up"
the directory there before trying transfers.

Please remember that System 6.whatever has a "max rsrc limit" in
an invisible file, Desktop. It remembers the icons of any program that
ever passed through your machine, there presently or not. Overflow it,
and the disk goes bang! in a big way. (I did this with a WORM backup.)
There are PD testers for this on the various Mac boards; I know CE has one.

I believe MacRead/MacSee are now shareware or PD, but a check of
BBS' or the big networks will tell you really fast.

Just what I remember about it ...

hope it helps,

Dave Small

I tried getting Twilight to work on my 2.5Meg STe, with no luck, the TSR part works, but the ACC/APP file just bombs by computer, clean boot, or full-works with Geneva, Neodesk 4, NVDI, etc. the result is the same.

The archive is 328984 bytes, does this sounds like a working version?

The only DOC file is one giving brief info' on installation etc, and it mentions absolutely nothing about how to register it etc. (Not that I'd register a program that doesn't work on my machine :)

While I'm at it, are there any really fast background MOD players for the STe? Paula is too slow, and often can't sustain even 12.5Khz playback, I've seen routines that play at 25Khz using only ~20% processor time, so surely a decently coded Paula/Jukebox etc. like program could manage 12.5Khz at about the same sort of slowdown....

>What about the "power without the price", anyway?
>

I agree that many things for the Atari line of computers is overpriced.

Unfortunately, economics dictates that a purely competitive firm will
maximize profits only when marginal cost equals marginal revenue. At this
point, the firm will only need to charge for the product what it costs to
produce that last additional item. Atari-specific producers rarely sell
enough products to reach this level.

The deals in the Atari world exist via the items we can buy that are mass
produced (SCSI drives, CD-ROMS, Monitors, bulk disks, etc). I try to
patronize Atari-specific dealers, anyway in these cases. There are also
real deals to be found in used Atari equipment. A lot of people are
leaving, and selling their products quite cheaply. I have no qualms about
stockpiling Atari equipment, as it quite suitably serves my purposes today,
and for the forseeable future (MIDI, DTP, Telecomm).

I was quite upset when I found out that the price of the Falcon Rack case
was $499, and not $259 as advertised in Toad. I saw the case at ACE, and
didn't really care for it anyway. But, I think its great that Wizztronics
is investing so much time and effort into developing products for the
Falcon. They know that they are not going to make millions in the the
Falcon development area, but still are dedicated. They also were showing a
nice graphical sample editor at the show.
```

Anyway, the Barracuda should be about $1000, without the 68040. A cool thing about this board, though, is that they will have a 486 emulator board that can plug into it for about $500. The 68040 board will remain fully compatible with Cubase Audio, but I know of little else. Also, these prices are quite subject to change pending the actual releases of these products.

An alternative to upgrade your Falcon is the Power Up 32Mhz accelerator. I paid $99 for mine. Once I download GemBench and register it, I will post the results (unless someone beats me to it!).

In a previous article, Lutz_Weigand@gi.maus.de (Lutz Weigand) says:

>Hi there,
>
>did anyone visit the Toronto exhibition? Any news?

I was there. It was in a very nice location (Memorial Hall in Downtown Toronto). I went only the first day (Saturday).

Lots of people there. The greeters/ticket-sellers at the door estimated 500-600 people the first day. There was a Jaguar/SARA/Edith/Calamus(?) package drawing.

Everyone that I saw there was buying something. Like me, they knew what they wanted, and spent little time asking questions. Gribnif was there demonstrating Stalker and Neodesk4 on a nice TT with a graphics card. Genie was there and they were giving away or selling disks of Alladin I presume. Toad, of course was swamped. They had a lot of programs and magazines and some drives. A Jaguar kiosk had the kids occupied. Compo was there- only taking orders for their products and Atari World subscriptions. They had a pre-release issue for everyone to browse- looked very nice.

Let's see . . . Fargo (printer company) was there showing their impressive color thermal transfer printers. Branch Always Software was there showing Gemulator (no one was at that booth when I was there- sorry). There were a lot of Falcons in site demoing products. Computer Direct shared a booth with the distributor of some Falcon games (System Solutions?). I bought Pinball Dreams- really good, even though I don't like pinball that much. ICD was there showing Calamus on a PC. Wizztronics had lots of rack cases and demoed their new graphical waveform editor. Best electronics was there with all the gadgets you could imagine (and then some).

I'm sure I missed some things (TAF Public Domain disk booth, etc). Mind you, this was only one room. I planned on returning the next day to see the MIDI room, but never made it. All in all, it was a very nice, upscale show (lots of nice monitors and systems that showed the programs).

I'm no expert, and this is probably overkill, but it works for bash.
set up a HOME environment variable pointing to the .rc file
Set up an ENV " " "
Regards,
Ian.

I might be wrong but Twilight is Falcon/TT only (e.g 68020/030 - 68882)
BTW, it works fine in a MegaST4+PAK3

474. Atari World on the news stands.

Newsgroup: comp.sys.atari.st
Date: 1995-04-10 00:00:00 UTC
From: em09@liverpool.ac.uk
Message-ID: <D6tHG4.MxH@liverpool.ac.uk>
Source record: 168093

I was fully expecting to hear via this group that Atari World was about to be published some time before it actually came out. But, to my surprise, I found the first edition by mistake in my local news-agents.

It seems to have got off to a very good start, let's just hope that they can keep it up.

John.

: Closing down HENSA for non-UK WWW traffic, *THAT* is a shame!!
: Not your fault ofcause, Danesh, but is there any chance of (limited) access in
: the near future?

Egbert, HENSA already has limited access restrictions for non ac.uk users...

ftp:
8am - 8pm (British time) 6 slots
8pm - 8am 10 slots

I am also going to be creating upto 5 slots for uploads, and this will
have no restrictions at all for people uploading.

gopher/WWW
8am - 8pm No access
8pm - 8am Full access

So, c'mon guys, log in, and download...if you wanna keep the Atari
section at HENSA going...

Hi anyone

I just want to remember you that there's the newsgroup COMP.SYS.ATARI.ANNOUNCE
for new releases of software!

I do so because this newsgroup is imported into the German MAUS-Net where
nearly
all German ATARI-Users could read your messages!

On the other hand I'm working in the MAUS-Net the other way round. The
programmer
of German Software should use this newsgroup, too, so you get direct
information.
Please help for better and faster information!

But please remember it's an INFOrmation-Newsgroup! Don't talk there!

Bye and thanks for reading!!

...Patrick

>The number of sold Falcons doesn't even get close to the number of other
>Ataris sold ... That's why.
An irrelevent argument. The sort of people still running 1/2MB STs without
a hard drive are not the sort of people who spend money on s/w. People
who have bought Falcons are people who have bought a machine _recently_, so
are more likely to still be using the machine and buying software for it.

I have _loads_ of Atari software, and it _nearly all_ runs under MagiCMac.
There are some hacks that don't work, and of course most games fail too.

I have been very impressed with MagiCMac's compatibility.

What does the magazine focus on? Is it similar to ST Format? Does it
focus mainly on computer (business, graphics, etc) or computer games or
console games (Jaguar, Lynx)? Does it try to balance all areas or does it
try to cover all areas, or is it geared more towards one of them more so
than the rest?

Thanks.

Which, lets face it, is the time when the majority of non ac.uk users will be logging in (and any decent ac.uk user will be down the pub getting in a few beers after a long day of system programming - I kid you not : the Computer centre at Preston used to be jam pack full of subversive programmers at 9:00pm as it was the only time you could compile at any speed)

You should try buying one without a hard disk and then asking to go on
their multi-Tos / hardware support scheme ..
"Sorry its only for people who bought Falcons with Hard Drives"

Well Sod them - I consigned multi-tos straight to the filestore and
probably saved myself an awful lot of time.

Steve (who never really multi-tasks)

Dynamic assigment of IP address is part of a standard PPP connection. You
will need pppd 2.1.2 (which should be available at ftp.cs.tu-berlin.de) anbd
the syslogd portion of MintOS (available everywhere). You do not need
to know a static IP address ahead of time for PPP.
>
> BTW, I must say the installation instructions are difficult to follow

This is a problem - we will be putting out some Xwindows distribution
disks soon which will have a step by step guide to installation.

>things set up?
There are a couple of us working on it - it will be ready very soon - I still
have to test SLIP connections since I've only been using PPP so far - SLIP
is the more difficult method of connecting so it's important we cover this
for the novice users who only have access to a SLIP (and not PPP) connection.

JK>owner, who had few problems with compatibility, there are only /very/
JK>few programs that will still run - however, it can be a good feeling
JK>to know that you haven't trashed everything in tragically selling an
JK>Atari. :-)

I am a Performa 630 owner since seven days and I still also have a Atari TT 030. MagiCMac on the 630 has at least double or triple speed than MagiC on the TT!
It's an excellent program but only GEM-programs without direct hardware access are aible to work with (so you may forget most of the games :-()
Most of the "serious" programs work with MagiCMac (for example Papyrus, GEMview, Calamus SL, Papillon, Pixart, Phoenix, E-Copy, Kobold etc.).
If you are using serious applications, MagiCMac is a good deal.
If you prefer games keep your 520 ST (I still have my old 1040STFM at my TV Monitor for games...)

bye, Volker

>I would also like to see an drag&drop application, that plays (and maybe
>displays sounds (WAV, AIFF, SND, AU, DVS...). If that wonderful 525
>could be programmed to play the sounds also, I would be very happy.

If you want to play the sounds, you'll need fortune. 525 will probably never
get that playing routine - because we would need 3 different routines: Falcon,
TT/STE and ST. All with different frequencies and only some able to
play 'directly' from hard disk. We have the necessary routines for
all machines, but well it gets too long and big...

>BTW: has anyone else got this problem:
>When exiting Fortune or 525, the desktop colour nr.9 is not set to it's
>original value, but always to R500 G500 B500. Is this because of those
>programs of the COLORVDI.CPX vr. 2.10?

I don't think our programs change the color AT ALL. So it probably happens
because the xcontrol.acc is exited at the same time, too.

Btw: You don't have grey as color 9? Doesn't that look strange in 3D
mode?

Bye, Harald

If its a Mega, it has no internal disk, then you can "MAYBE" disable the
fan. The best solution is a soundproof box, however, they usually come
with a fan as well!!! (wery silent, but still a fan)

I have experineced the same, but it does not come from the monitor, it is
from the midi interface of the Atari. Port 1 is not standard and I believe
it has something to do with grounding

I don't know if this helps (maybe), but you should be using the
MiNTOS-package anyway, if you don't do by now. You will be able to
manage real home-directories, in any of which you may put a
.tcshrc-file, which will definitely be read if the appropriate user
loggs in. Also, a specially-named file in /etc is read as a
system-wide pre-definition. I can't remember the name now, but it is
mentioned in the tcsh-man-pages.

I think you have your DESKTOP.INF or NEWDESK.INF too large. Try reducing the size of it. It is the environment memory that is overflow, that's why your opened windows are closed, there was no space left to keep that info in the memory.

I've just uloaded chimera-1.65.tgz and xfm-1.3.tar.gz to ftp.germany.eu.net
and xfm-1.3.tgz to ftp.uni-muenster.de.
Chimera-1.65 is the lastest Version of the well known WWW-Browser.
xfm-1.3 is a filemanager for MiNT-X.

enjoy Theo

I found a registered copy of Opus with WKS/WK1 file support on some ftp
site, maybe it was the Finland one though I can't remember for sure.
Normally I would not condone downloading an illegally posted registered
version of any shareware from an ftp site, but under the circumstances,
being that Doug Harrison can apparently no longer be reached, has
completely stopped improving or even supporting his software, and has
screwed over many people (including myself) who have sent him money to get
the registered version, I will use situational ethics to justify it in
this case. If other people have comments about this please speak your
mind but don't flame me.

The software is not *exactly* free (You had to buy the magazine! And
they payed for the program). I've got a copy of Harlekin II from a mag
and it states explicitly that it is *not* freeware.

I think that you are violating copyright laws if you are spreading
copies of programs that do not encourage you to do so.

: : DS>for the mac?

: : Of course. MagiCMac. But I wouldn't suggest you to buy it. In my opinion, it's
: : slow

: This is just a lie. Why do you do lie ? Revenge ? Hate ? Envy ?

Well... Whatever else MagicMac is, it certainly isn't slow. It's a magnificent piece of software. I know that this is a very personal opinion (!) - but I see the Macintosh itself as the weak point.

Why? It may have a fast processor, etc. - but it's really hard (for me) to get used to a motorized disk drive. Especially with Atari programs! The compatibility isn't very high yet - but this isn't a fault of MagicMac itself. The Eagle, Medusa, and sometimes even Falcon face the same problem: many older programs (some new, too) expect to find some hardware that just doesn't exist in Macintoshs.. =-(

If the demo version gives any clues about what to expect, this is the current situation:

MagicMac runs many (not all) commercial applications, but few ST- and Falcon programs. If a program works perfectly on a TT, especially with graphics cards, it may work on a Mac, too. If it has problems with TT, then... Well, this is a very coarse comparison. I just don't want people who own a ST to think that by buying a Mac and MagicMac, they will get a perfect, ultramodern Apple-ST that runs practically all their existing software. This is not the case, unfortunately.. So, whatever we think, there still exists need for real Atari computers. I think, if might be ideal to own both a fast Mac with MagicMac (MacOS isn't that great, after all) - and a Falcon. The best from the both worlds..

Source record: 167918

Manuel Leboucher (lebouche@univ-caen.fr) wrote:
: is anybody knows why the access of the WWW page th Atari section
: (micros.hensa.uk) is forbidden ?

OK, here goes:

The HENSA/micros servive is funded by the Joint Information Systems Committee (JISC) in the UK, for the benefit of the UK Higher Education sector.

HENSA is therefore committed to providing the best service for the UK education sector.

We keep extra slots for people outside the UK academic sector, as we feel that there must be people out there who use our service, but when the quality of service to ac.uk users is in jeopardy, then action has to be taken.

HENSA/micros has increased in popularity over the past year. Maybe this has to do with the introduction of the WWW, i don't know. However, because of this popularity, too many users were getting onto the system for the system to be able to handle them...the system was grinding to a halt, and this was even affecting the systems admins accounts. Something had to be done....and so restrictions were placed.

Looking at the user logs, we saw that there were far too many people outside the ac.uk domain accessing us, as compared to the ac.uk users. ac.uk users were complaining about the speed of connections. Thus, action ahd to be taken for our primary customers...the main reason we are being funded. All access was closed to non ac.uk.

We then got a lot of complaints from these other users who couldn't get in...and thus decided to give them restricted access....

non ac.uk users have unlimited gopher and web access within the hours of 8pm - 8am British time.

And I apologise for the restrictions, but they have to be kept to, if HENSA is to survive as a viable service.

Regards
Danny

But unless there is some form of copy protection, most of the copies
in circulation will be pirated, judging by past history. And legitimate
buyers will hate the complication (dongle to fail/lose, key disk to
insert) that goes with copy protection. So maybe shareware is the
way to go. In any case, good luck to any programmer who takes on
this project.

Actually, if you open up the Mega, you'll find that the fan mostly is to cool down the power supply. Since the MC68k has a working temperature of approximately 20 (compared to Intel's 80-90 C), I don't think the CPU will be the problem - it is the power supply.

Yes (and no). On my machine (MegaSTE 4/40) Uniterm "scrambles" the image.
Periodically lines gets distorted. (No auto.prg, no desk.acc)

When I zoom in there are no (ehrmm.. only minor) errors. If I save the
input and replay later everything is fine.

Uniterm was the terminal that I was (still is) originally using.

> I might be wrong but Twilight is Falcon/TT only (e.g 68020/030 -
> 68882) BTW, it works fine in a MegaST4+PAK3

It is my sad duty to report that TwiLight the Screensaver does not -repeat
not - work on non-German STs! As the Swedish distributor for this excellent
utility, I'm desperately awaiting a report from the German programmers, saying
that the bug has been found and stomped out!

Twilight does a terrific job on *all TTs and Falcons* plus German 16 bit
Ataris. It's the most entertaining and stable screensaver I've ever seen, and
hopefully it will be running on all Ataris soon!

Yours sincerely

> MacOS isn't that great, after all

You should probably add an 'IMHO' after that remark as many would be
inclined to disagree with you. If I can't have a fast Atari TOS machine
at a decent price, I'd MUCH rather use MacOS than DOS or Windoze. But
then again, that's MY opinion, not a statement of fact for everyone. :)

MagicMac is an impressive piece of software, no argument there. I just wish
that more Atari stuff was compatible with it. Not a bad start, though.

If one can be fairly certain that an author has stopped supporting a given piece of shareware (and not simply moved to a new address), has turned it over to the public domain or made it freeware, or simply cannot be reached then I think few logical people would complain.

IMHO, it is the shareware author's responsibility to keep the community advised of new addresses and/or registration procedures and benefits. If they fail to do this or take money without shipping software, then what else can they expect?

I would still be cautious before jumping to conclusions, however.

Just my $.02.

Wellllll.... personally, I'll have to SEE it before I believe it. ;-)

Yes, the -potential- is certainly there for a really great modem running
in software only due to that super slick little DMA chip in the Falcon.
But I have yet to see a software-only modem that lives up to that potential.

Apple has been manufacturing the 'Geoport' which is really just a telecom
port for hookup to it's AV (the ones with the DSP chip) and PowerMacs. While
this combination does work, most users report that it has not proven to be
very reliable. Especially considering the falling prices of 14.4/28.8 v.42
hardware modems one has to ask if the concept is really worthwhile.

I don't know who in Germany was developing the software modem for the Falcon
and it's possible that they will be much more successful than Apple. I wish
them luck, but I remain a bit dubious.

I haven't looked into it at all, but I would have thought that the
56001 in the Falcon is well capable of full speed modem functions. I don't
know what typical processor commercial modems use, but if it's more powerful
than a 56001 at 32MHz it must be quite something!

I don't know of any built-in modems available for the Falcon, but
I'm interested. Where did you get the source code from?

Yes, it exists! (Hi everybody, I'm back... "1875 New messages in comp.sys.atari.st" Arg! What have I missed?) The file you are all seeking I found on ftp.cnam.fr and I believe the file is called "ED_POV.ZIP" or something close to that. I tried it out, and it looks quite good, but my french isn't very good so I didn't get too far. I can tell you though, that it seems to support a complete installation of POV, and will create objects and scenes, and apply textures, and from what I can tell (I don't know because I needed the HD space that POV was taking) it can also launch POV. If I remember correctly, it does work under MultiTOS, and it has a very nice 16 colour interface.

I would have spent more time with it, but I find POV too slow and bulky compared to InShape. (And* my french isn't very good...)

Sorry I can't remember it's exact location or name...

555. Re: Toronto Atari show

Newsgroup: comp.sys.atari.st
Date: 1995-04-11 00:00:00 UTC
From: jack@aurora.carleton.ca
Message-ID: <D6usuB.Cqs@cunews.carleton.ca>
Source record: 167947

The one product that really suprised me at the show was SEURAT version 3
from SKWare One. I haven't really heard anything about this program
before. It has loads of nice features, a nice 'degas' type interface and
is really fast even in 640x480x256. Clearly blows Truepaint out of the water
which is the only other competition as far as I know. The pallete manipulation
tools were very nice. This is a winner. The Falcon version is $70 US.

There was also a single copy of DIGITAL TRACKER for the Falcon at the Ram Gizmo
booth. This is another great buy that is on the top of my list. You can
grab a demo of the pre-release version on most Atari ftp sites with Falcon
stuff.

The Falcon rack from Wiztronics looked great IMO but was prohibitively priced
at $525 ($325 for the BARE case). As I'm sure you've all heard by now, there
was no working Baracuda accelerator, just a couple empty boards to look at.

I managed to get at these important facts when I talked to one of the tech guys
at the booth:
1) You get to keep any ST-RAM board you may now have inside the Falcon.
RAM-Gizmo etc and.

2) There is a hardware switch to let you revert back to the old-Falcon mode
(thus the claim for %100 compatability:) This means you can still use
things like Blowup and ScreenBlaster when the accelerator is turned off.

3) access to ST-RAM is just as fast with the accelerator as without: no changes
with ST-RAM. 32bit flash ROMs are used for the modified TOS OS on the board
which means ROM access will be faster.

4) One of the major difficulties with the design was the RAM controller
because it must work correctly with both motorolla and Intel memory .
When the 486 board is plugged in the 040 is used as a DMA (VLB? type)
controller.

5) The TT-RAM is 32-bit @ 32MHz (regular 60-70 ns SIMMs)

You're wrong! On DSP56k you can have the best modem you've *ever* seen.
There was a software modem at stock in Germany (V.42 bis...) for two
weeks, but with price 200DM you will have extra inteligent modem - F030 for
~2000DM. So the big companies have bought the copyrights for that software.

Sorry for the mess on the bottom of my messages...

Seemed that there were tabs in my signature file, I think I fixed it now,
anyway, this message should be a test for that.

: : David Stewart wrote:

: : Of course. MagiCMac. But I wouldn't suggest you to buy it. In my opinion, it's
: : slow

: This is just a lie. Why do you do lie ? Revenge ? Hate ? Envy ?

This seems a bit "dangerous"; both to put down MacOS - and MagicMac.
People seem to think that Macintosh and its OS is above criticism, just
like people on the PC side think we have no right to criticize Windoze... :-(
Well, not everyone - I know. It just feels sometimes that way..

But anyway, I'd like to know, whether the "real" MagicMac has a
dramatically better program compatibility than the demo? This is,
because the more I try _new_ programs on MagicMac, the more I get the
impression that more programs don't work than do work.

This isn't any revenge, hate, or envy either - since I'm really
interested in MagicMac. Especially, if Barracuda 040 for Falcon will be
priced above my budget.. But it worries me, that most shareware I try on
Mac, just crashes the machine. Even software that runs on Falcon (which
isn't a compatibility wonder, either) often fails on MagicMac. Too often
- to make me comfortable...

How is it, folks? Some of you say that almost everything runs, except
games of course - and I don't seem to have much success, despite my 9
year Atari experience. Am I really _this_ stupid, or what's the truth ;-)
? Mac seems to hate me, anyway. It's a wonder, how _every damn day_ I
use the Performa 660AVs or Quadras at GSU Computer Lab, those great
programs get somehow stuck - crash, bang, boom! Yesterday I (for the
first time) witnessed this: MacOS crashes, if you try to format a DOS
disk that contains bad sectors. It swallows the disk, and just dies... Or
at least, that's what happened yesterday. My neighbour on the right
couldn't print, because her word processor produced postscript errors and
jammed the whole pronter. PageMaker sometimes prints o.k - but sometimes
just produces PostScript errors. And even when it prints o.k - the
kerning on screen differs a lot from the actual result. Something that
never happens to me while using Calamus...

I'm glad people generally love their Macs. It's good to have something
you like. But I never take seriously folks who ("knowing better..") come
to me and say: Mac is THE real computer, for people who want REAL
results.. Can't help it, but Calamus SL is superior to anything I've seen
on Mac. For some people that's hard to believe, or take seriously. But we
really have no reason to envy those Mac users. It's just funny that if a

Mac user spoke like this, everybody'd take it as a fact ("PageMaker is superior to Atari DTP progs.."). But when an Atari user claims to have something better than Mac has..? It's hard to believe, isn't it? It just sounds like empty words, or trying to irritate others. Do we really ever question some things?

And do we need people who question too much, and irritate the others?

Well, some people really don't like those who think different.. At my home university, the local computer experts (Windows/Mac people) almost shot me, after I told them we were going to make a magazine using Atari, instead of their "real" computers. Some still don't talk to me :-). Telling them: "Atari and Calamus just work better for our project than Mac and PageMaker.." was like a personal insult towards them. And also struck a "non-trustable Atari fanatic" label on us, who didn't know what "REAL" computing is like =-) ! Oh, that wonderful Windows world 8-) !!

Crazy (me and the world)

>I was just wondering if software like this can be copied or if they're treated
>in the same way as if you buy the actual software by itself.
>I'm in doubt since the software is free (included with the magazine).

Any software on a coverdisk other than specific PD and Shareware titles remains
the copyright of whoever put it on the coverdisk. Therefore you are not
legally allowed to sell the coverdisks without the magazine and therefore you
can not keep a copy of this copyrighted software.

Basically, the Publisher pays the copyright holder a fixed fee per copy sold,
they then allow the purchaser to buy the rights to that one disk by buying the
magazine.

Hope this clears like mud<g>

I was able to get Calamus Sl Demo to run fine.

Something everybody needs to remember is MagiCMac is not a Emulator its an Operating System.

What seems to work best on the MagiCmac is programs that do not write to the screen or directorly to the hardware (MIDI and Most Games.) I have only found one game that works (battlezone the Unix port)

Most of the shareware text editors work QED, 7up GFA and griffens' steno works. I could not get Neodesk 3.0 to run and Gemini will not let you read directorys

As for your Macs in your lab try turning off some of those "Shareware" control panels and extensions. I bet things will work a lot better.

Look for a what work and what don't listing Soon

Simple - they're just taking their lead from Micro$oft and the Chicago fiasco.
This is known as the FUD approach - announce something before it's even been
coded, then let the release date slip; meanwhile, Joe Punter won't buy any
alternatives 'cos he knows that they won't be as good (the company told him,
so it must be true :). Examples - GEM vs Windoze 1 & 2, Warp vs Chicago etc.

Why ASH & 2B feel a need to do this, however, remains a mystery <g>

If you look inside a .ps file you will see that the body of the text
is in readable ascii wrapped up in font and layout information. Text
inside images will not be readable of course. However if you are
willing to wade through the postscript commands you can read the text
directly.

I have seen a unix based converter but it was not very usable.

It should not be too difficult for someone with a Phd to write a
converter to extract the ascii text and do the basic layout (eg
paragraphs and headings) :)

Please do not mix up the SCSI-2 standard with class 2 commands. Class 2
commands (as used for audio) have been in use for a long, long time.

>Some Atari-hostadaptors do not support sending II-commands. ICS introduced a
>certain "hack" to enable just that.

Yep. But again, these are class-2-commands. This has nothing to do
with SCSI 2.

Of course.

>What are the newest version of AHDI?

Won't support a second IDE drive.

590. Re: TwiLight - Screensaver

Newsgroup: comp.sys.atari.st
Date: 1995-04-12 00:00:00 UTC
From: Lutz_Weigand@gi.maus.de
Message-ID: <199504122015.a6715@gi.maus.de>
Source record: 167732

Hi there,

SW>70DM for a screensaver?! People pay this kind of money just so they
SW>can get pretty pictures flying around the screen while they're out of
SW>the room?
SW> Have a look at "Darklord" and "Before Dawn".

But...Twilight is very well GEM-"cleaned" programmed and some of the
many modules are totally crazy. It's also with sound.
For example the drinking pinguins: You can choose there
alcoholic level and what they drink. they walk...tumble..drink...and burp..
they are even leave a green **** ;-))
They also have an DOS Emulator and PONG as screensaver(you can even play pong)

So for me its not only a screen saver, its also amuzing.

Regards Lutz

P.S. It is worth every DM

You should never give up.... Once again:
I use un old Spectre 128, laser SLM 804, Mega 4 and SM124. The system worked really nice.

But then,
I changed to the big monitor SM194 with Atari monitorcard, and changed HD with Top Link 2, and now the laser doesn't print, (paper comes out but nothing on it).

There must be someone out there who has a GCR and know the answer about 19' screen and GCR?! I got one answer (thank you!) but he referred to the manual, but mine is too old.

From what application?

NVDI 3 can redirect output into a file for any GDOS application.

>CD-ROM and they seemed to work fine.

THere's only one kind of TrueType font, but each font differs in the
number of character set encodings stored in the font. eg UNICODE,
Macintosh, Windows.

My guess is that the font you tried had a character set that NVDI 3
didn't recognise.

No-one knows exactly what kind of TT fonts NVDI 3 and Speedo 5 really
like...

Have you come across DCX_PLUS.PRG which provides a windows/mouse
interface to built in .zoo (& .arc, .lzh .zip) de/compression.

It's idiosyncratic, but easy to use, 'fairly'' reliable and shareware
(though I seem to remember that Double Click Software doen't exist
anymore?). I also seem to remember it being on a UK magazine disk
quite a while ago.

jason.

Subject: Midi files/software archives on the Internet

Posted-By: auto-faq 2.4
Archive-name: music/midi/archives

Version: $Id: archives,v 1.121 1995/02/24 14:44:20 piet Exp $

Note: the latest version of this file is available from the ftp.cs.ruu.nl
archive as MIDI/DOC/archives (see below how to access the archive) and
on the various news.answers archives. This archive also contains a lot of
midi music and programs. Mirrors of the MIDI/SONGS directory or the whole
archive can be found on the following sites:
ftp.cis.nctu.edu.tw /MIDI/SONGS/
ftp.pu-toyama.ac.jp /pub/ftpmail/ftp.cs.ruu.nl/pub/MIDI/SONGS
ftp.monash.edu.au /pub/midi/SONGS
ftp.funet.fi /pub/sounds/midi
ftp.ibp.fr /pub/midi

A large collection of midifiles can be found on wuarchive.wustl.edu, in
/systems/ibmpc/ultrasound/sound/midi/files. Some of these files are
specific for the Gravis Ultrasound card but most are also usable for other
synthesizers.

There is an FTP archive at ftp.ucsd.edu [128.54.16.7] . It contains a.o. MIDI
files, patches and a few programs. See the directory 'midi'. This archive

looks rather out of date, by the way.

There is a demo of Symbolic Composer at media-lab.media.mit.edu [18.85.0.2] (directory 'music/midi') and on sumex.stanford.edu [171.65.4.3] in /info-mac/Application/ (symbolic-composer-*). It can probably also be found on other info-mac archives. More Symbolic Composer stuff can be obtained from Fokke de Boer by e-mail to Fokke.de.Boer@rivm.nl a message with Subject: retrieve directory and following the instructions that you will receive.

atari.archive.umich.edu [141.211.120.11] contains Atari stuff in directory '/atari/Music'.

scam.berkeley.edu [128.32.138.1] contains netjam submissions on midifiles in directory '/pub/misc/netjam/submissions/'.

Sites for MIDI Sample Dump Standard programs and samples:
alf.uib.no [129.177.30.3], directory /pub/sds
sweaty.palm.cri.nz [161.66.1.11], directory sds

wagner.musicnet.ua.edu [130.160.156.75] is a site that just started to collect music stuff. It has patches for Roland JV-80/880/1000 in directory /pub/music/patches/jv80.

oak.oakland.edu [141.210.10.117] has EPS/EPS-16+/ASR samples in /pub/eps/samples. More EPS info is in pub/eps/docs/. There are some programs for the EPS in /pub/eps/utils (Atari ST, Amiga, MAC, MSDOS). See pub/eps/docs/utils for info. Feel free to access oak.oakland.edu using Gopher (gopher.acs.oakland.edu, port 70) or WWW (Mosaic/Lynx URL: http://www.acs.oakland.edu).

Ftp sites for the Kurzweil K2000:
1) ftp.uwp.edu:/pub/music/lists/kurzweil (maintained by jbuckman@aas.org)
2) bach.nevada.edu:/pub/k2000 (maintained by johann@nevada.edu)

bach.nevada.edu also contains christian music midi files in /pub/midi.

qiclab.scn.rain.com in /pub/music contains various conversion programs.

Roland Samplers:
There is an FTP archive that includes introductory information, useful utilities (read Roland disks on your computer), archives of the mailing list, and some samples. The archive is on lotus.UWaterloo.ca in the pub/sgroup directory.

There also is a ftp-site with TX16W samples, maintained by one of the TX16W list-members. FTP to ftp.informatik.uni-freiburg.de [132.230.150.1], the samples are in the directory "pub/sounds/tx16w/samples". There are also back issues of the TX-16W newsletter in pub/sounds/tx16w/mail. A WWW entry is http://ls7-www.informatik.uni-dortmund.de/html/tx16w.html

Archives of the Music-Research Digest can be found at cattell.psych.upenn.edu [12128.91.2.173] in directory pub/Music.Research

impaqt1.mem.drexel.edu [129.25.10.1] has a couple of msdos files in
'pub/files/ibm/midi'

There is an EMAX (I and II) FTP site at sweaty.palm.cri.nz (161.66.1.11)
some samples, FAQ, archives of mailing list and some software to allow
sample interchange for PC compatibles

Cakewalk files can be found at ftp.funet.fi [128.214.6.100] in
'pub/msdos/sound/cakewalk' and also on ucsd.edu (see above). More cakewalk
stuff (including archives of the Cakewalk mailing list) can be found at:
ftp.cs.colorado.edu:/users/mccreary/archive/cakewalk or on WWW as
http://www.cs.colorado.edu/~mccreary/archive/cakewalk
There is a VFX archive in the parallel directory mccreary/archive/vfx.
Another site for Cakewalk is mort.isvr.soton.ac.uk:/pub/pc/cakewalk (ftp) or
http://www.isvr.soton.ac.uk/People/ccb/Cakewalk (WWW)

There are several MIDI programs for MS Windows in
ftp.cica.indiana.edu:pub/pc/win3/sounds.

OS/2 programs can be found on ftp-os2.cdrom.com [192.153.46.2]. Directories
/pub/os2/2_x/mmedia and /pub/os2/2_1/mmedia contain the bulk of the
MIDI-related files for OS/2. (There is a specific ftp site for OS/2
multimedia in the formative stages right now, but it is not yet in
operation.) For a full index of OS/2 files at that site, retrieve
/pub/os2/00index.txt. Submissions may be placed in /pub/os2/incoming.

mac.archive.umich.edu [141.211.165.41] has a Macintosh midi archive in
mac/sound/midi

Other Macintosh sites: See the file Mac-archives in this directory.

An FTP site for predominantly D-70-related files: /pub/D70 on
kilroy.jpl.nasa.gov.

ftp.neuroinformatik.ruhr-uni-bochum.de in directory
/pub/outgoing/heja/sy-list there are several infos/sounds/programs of
interest for Yamaha SY users (this is the "inofficial" ftp-site of the
sy-list). IMPORTANT NOTE: go directly to the above mentioned directory!
Access via WWW:
http://www.neuroinformatik.ruhr-uni-bochum.de/ini/PEOPLE/heja/sy-list.html

The site contains mostly original material and is not a mirror of the big
music archives.

ftp.ecn.nl:/pub/RP-1: DIGITECH RP-1 MIDI guitar effect pedals and some
other midi stuff.

Apple 2 MIDI Synth archives can be found on cco.caltech.edu [131.215.6.10]
in the pub/apple2/music/synthlab/ directory. They are mirrored on
grind.isca.uiowa.edu [128.255.21.233]

Amiga users can get some things by mail from mrcserv@janus.mtroyal.ab.ca
(send a HELP message first)

For amiga see also the aminet sites:

litamiga.epfl.ch 128.178.151.32
ftp.luth.se 130.240.18.2
ftp.uni-kl.de 131.246.9.95
ftp.uni-erlangen.de 131.188.1.43
ftp.cs.tu-berlin.de 130.149.17.7

ftp.wustl.edu 128.252.135.4
ftp.cdrom.com 192.153.46.2
merlin.etsu.edu 192.43.199.20

There is a listserv containing e-music related stuff at American
University.
Send a message to listserv@auvm.bitnet containing the line:
get emusic filelist

IRCAM:
IRCAM operates an anonymous ftp site, ftp.ircam.fr, with programs and
information on music, DSP, multimedia, infosystems, networking, etc.,
for unix platforms, macintoshes and PC.

(amongst others:)
/pub/
music/ Computer music software and info
databases/ Music databases
doc/ Documentation
FAQ/ FAQ about audio, dsp, etc...
MIDI/ MIDI standard definition
programs/ Repository of public domain computer music programs
snd/
It also has a WWW server on similar resources, http://www.ircam.fr.
This includes a MIDI archive (programs, sounds, patches, docs)

Computer Music Journal Internet Archive and World-Wide Web Home Page:

mitpress.mit.edu:/pub/Computer-Music-Journal and
ccrma-ftp.stanford.edu:/pub/Publications/cmj

Tables of contents, abstracts, and editor's notes of several volumes of
CMJ.

World-Wide Web (WWW) home page in the file CMJ.html (e.g. URL
ftp://mitpress.mit.edu/pub/Computer-Music-Journal/CMJ.html)
---
ftp.mcc.ac.uk /pub/cubase Cubase archive. Contains Atari, Mac and
MSWindows demos
---
ftp.waldorf-gmbh.de: A site with information, patches etc. of Waldorf
products, contains also a lot of other Midi stuff. Also reachable by email
to archive-server@waldorf-gmbh.de (send a HELP message). See also mailing
list section below.

You'll find some NoiseTracker/SoundTracker MOD files, and Soundblaster
things on the following FTP sites:

Garbo.Uwasa.fi /pc/sb and /pc/music
Wuarchive.Wustl.Edu
Simtel20.Army.Mil
ftp.funet.fi /pub/amiga/audio
/pub/atari/sound
/pub/unix/sound
/pub/msdos/sound
ux1.cso.uiuc.edu /amiga/mirror/mods
ftp.brad.ac.uk /misc/mods /incoming/mods
ftp.uni-kl.de /pub/amiga/mods
/pub/amiga/ianet/mods

/ftp.eng.ufl.edu:/pub/msdos/demos/music/ contains several music files,
demos etc. (hardly any MIDI, but mostly MODs etc).

The demo version of QSEQ, a complete sequencer for MSDOS/SoundBlaster, is
available by email automatic server. Just send a message to
qseqmail@h2o.cad.cea.fr with the following line in the body of the message:
sendqseqto <your-complete-email-address> or sendhelpto
<your-complete-email-address> , if you just want an help file about the
mailer and QSEQ. QSEQ is also available on SIMTEL mirrors
(oak.oakland.edu, etc...). And from
ftp.cs.ruu.nl:/pub/MIDI/PROGRAMS/MSDOS.
---
ella.mills.edu in /ccm/tuning contains files about alternative tunings,
a.o. back issues of the Alternate Tuning mailing list, software to put
synths in alternate tunings and a bibliography on the subject. You can also
acess this archive by sending a message to listproc@varese.mills.edu. See
the file /ccm/README for more info about this archive.
---
ftp.und.ac.za (University of Natal, Durban) contains midifiles and programs
for the Sound Canvas and MT-32 in directory: /pub/pc/midi/

The EMUSIC-L mailing list (see below) archives can be found on the WWW
http://sunsite.unc.edu/mcmahon/emusic-l/welcome.html. Ftp access will be
available soon.
--- A
ftp.mcc.ac.uk contains the archives of the Emagic Logic mailing list in
pub/emagic/ListArchive and other MIDI stuff in pub/MIDIMISC.

As we get older and everything around us gets more and more modern
there will always be a time that we are gonna hafta getta whateva we
need to keep ourselves going, if you see what I mean (probably not).
Clearly that is not going to be an Atari!? (I do think it is good to
resist the temptation as long as possible, but really, even a
hyper-upgraded TT nowadays is getting slightly old-fashioned, isn't it?)

I'd hate to install Mint just for a WWW-browser. Isn't there any
workaround for getting a stand-alone (just click it on the desktop)
browser? Please!

>Magic runs over Mint? I would like to write something accessible to
>all Atari users - is it reasonable to expect most Atari users have
>one of these OS's to use?

No.

>GDOS would also be a requirement as there is again no need to
>re-invent the wheel. I think most Atari owners
>have access to GDOS and some fonts.

Yes, but IMHO the fonts should be supplied with the browser (Speedo/
Truetype & GDOS). Otherwise the screens could become a mess due some
odd kernings and line-widths.

>Let me know what you all think... when I have some time I will start
>developing a strategy for coding. I would like to write something
>that's relatively efficient so 8Mhz ST owners can enjoy browsing the
>WEB and 48Mhz TT owners (like myself) can show off how much faster
>our WEB browser is than those on other home platforms. (hey calamus wins
>hands down for DP speed compared to anything on any platform).

I think you should aim for an independent product (no extras except
GDOS needed). I'm a sort of an Atari "power user", but still not willing
to use any hard-disk space for Mint, or spend hours installing Linux.
Plug&Pray is what is needed. Don't make the product suffer fro too
complicated installation. Good luck!

I have to disagree somewhat - the computer you _need_ is one that
satisfies the requirements of what you have to do. If you're saying
that PCs are getting more modern - think again. The basic layout
and hardware is still one of the worst computer architectures possible.
Sure when the 386 came out they had the means to change it but, unfortunately,
the software standards had already been put in place and they stuck with
the PC-AT type architecture. PCs are still nowhere near using the capabilities
of their high end CPUs - the other thing is that software has been
written so grossly inefficient for a long time now that some PC programs
are actually unbearable to use, even on a 486/66!

Macs are a little further ahead in the game, but the new system software
is a real dog. You can also predict what Win9x will run like if it
ever makes it to market. Unix type OS's are definitely the way to
go - that allows platforms with the latest and greatest technology
to be 'compatible' with standard software and still use all of the
bells and whistles on the new technology.

The real advantage the high end Ataris (like 48Mhz TT's with TT-RAM) have
is that much of the software is designed to be bearable (and quite useable)
on an 8Mhz ST - needless to say software flies on a TT. Have you seen
Calamus on a TT? It was way ahead of its time. The major disadvantage
is a lack of 'compatible' software - this is somewhat moot when things
like AtariWorks and Papyrus Gold come out and support RTF. You don't
need to run WP or WORD (besides you need a REALLY high end PC to run

these without tossing it out the window!)

I would eventally want a Unix-based workstation with the future things I plan to dabble in but for now I have no need for a PC - my TT does everything I need it to do. Besides now on my TT I can run Atari,Mac, and Unix (including X windows) software. Needless to say there is a lot of stuff out there but most people only regularly use a few key packages.

Hello

I was just wondering if anyone has any info on this graphics card for my TT. I have sent several E-Mails to CyberCube Research on Genie but have received no replies. Does anyone have any idea what has happened to this company and if they are still actively around. If anyone knows other sources for same say someone like TOAD I'd also like to know. Would also appreciate other TT users experiences with various graphics cards in particular this one.

Look forward to the info and cheers from OZ

: to use a quantum drive or something equivalant.

: thanks in advance!

I'm trying to do the same thing with my STE. What I really want is to install
an internal drive *inside*(!!) my STE.
I know this can be done with 2.5" drives (very expensive), but possibly
also 3.5" drives (reasonable). I'm checking around for IDE controllers
in Germany now, and I've seend several ads for them, and found a very reasonable
one somewhere. I'll let you know if you're interested.
You shouldn't need an external power supply as well as the case, which would
let you save quite a bit. I'm also awaiting a PCB for an IDE controller which
has the DIL type socket for the 68000 processor, but will hopefully adapt for
the STE's square PLCC socket (the changeover from DIL to PLCC is easy-peasy,
but I'm not sure if the electronics of the two machines are the same, as
someone told me it wouldn't work). I guess I'll just have to try.
Anyone else got info about this?
Incidently, the IDE project is from the German magazine C't.

Looks like my save disk for Legends of Valour has spun its last. Who's silly idea was it to make a proprietary save disk, anyway? Well, at any rate, needless to say, now that the disk has gone to mylar heaven, I can't save games any more ... does anyone know where I can get another save disk? Or if it's possible to format my own save disk? (I tried a normal disk; it doesn't like that at all...) OR even if it's possible to save to the hard drive instead? (I've never been partial to floppies... I wish more games installed to the hard disk) Any info would be most appreciated.

Electronics is usually safe up to 50 deg. C. You could stick a
thermometer on the HDD and onto the processor chip of the Mega to check.

At one time I saw a simple circuit using a thermistor which would only
switch on the fan if the temperature was getting too high. A lot depends on
the ambient temperature so don't do anything drastic until you have checked
the electronic temperatures on a warm day!

Hi, this is a very typical error and has something to do with bad timing on
the 16MHz clock of the falcon. The only real cure is a hardware patch, the so
called "clock patch". To give you a quick workaround: use as few colors as
possible, max. 16! Then no problems should occur.

Greetings,
Thomas

IMO, the distance is sufficient to not influence the monitor.

> 2) The 1040st and 1040STE don't have fans. Can't I disable the fan

HMM, Mega 2 with 4 megs? Are there any other modifications installed in that
machine?

You can easily reduce the noise of the fan, if you cut out the plastic cover
in front of it. Use a sharp knife.

> 3) Simply turning the monitor, and especially the computer on, adds
>line noise to the mix. I've tried using an outlet strip that filters noise

Try to move 'em as far apart as possible. Play around with the way you've
plugged the different machines to the mains.

Is the shielding of your cables done correctly? Perhaps wrap some metal-foil
around the sensitive cables.

: No.

But having said that, I am in favour of compulsory ownership of MagiC :-)
Since I first tried it many months ago, I have NEVER booted without it
(except for colour games). It revolutionizes the way you work, and cures
all the bugs and speed deficiencies present in (almost?) every TOS.

Just My Opinion!

: I added an icon on the desktop.

If it turns out that your DESKTOP.INF or NEWDESK.INF file is too large for
the buffer, the buffer size can be increased. You need a program called
SHBUF (Shell Buffer), and also GEMRAM or ROMSPEED. If you use WinX you
will already have one of these latter 2 installed.

F > distributed with info. to get people started, and that they
F > would report here after then (April 3rd or something). Did
F > this actually occur? Any idea how whoever it was got things
F > set up?

Well, yes and no.

The software WAS ready for demonstration at the show.
Unfortunately, in trying to demonstrate it there were some problems
with the hotel's phone system, which wouldn't allow for proper
internet connection. The disks weren't ready at that moment, either.

However, Sam Mesbah will be returning to the TAF meeting on
April 20th to have another go at demoing it. TAF will also be
offering the necessary disks in the near future (I don't think it
will be in time for the meeting).

Anyway, Sam is on this conference and he IS interested in
hearing in interest in his project. You can get in touch with him at
sasmesba@kingcong.uwaterloo.ca .

I'll let you know more on what's going on....

... Oh! Here's your problem... you had it set for evil.

Yes for a German with German Wages, but the added options are way over priced,
go read AEO 404.....

I can get a Full Pentium for that price and with CD Rom and with Monitor..

And for a outdated machine and a Buged OS who are you trying to kid...

Re: Graphics format for Degas compressed pictures...

There used to be a regularly posted file of graphics formats, including Degas compressed, compiled by David Baggett, and posted here in c.s.a.st monthly.

I haven't seen it here in quite some time, but I'd imagine it should be on Atari ftp sites. I know we have it on CompuServe (at least I hope it's still there..!), so if it can't be found anywhere else I could mail a copy out...

Re: What's needed for an Atari hard drive...

You'll need a "host adapter" like the ICD Link (available direct from ICD or from stores like Toad Computers in Maryland) which comes with the necessary drivers, utilities and cables to connect to the DMA outlet on the STe.

Then you'll need a standard SCSI hard drive mechanism which just plugs into the ICD Link.

Finally you need a case to put it all into, and a power supply.

Be aware too that early units of the 1040 STe had problems with their DMA chips which can possibly trash a hard drive's file system at random intervals.

I don't remember the exact details, but you can check the part number on the chip to determine whether it's one of the suspect chips or not.

Message-ID: <3mj1rnojt5@mhade.production.compuserve.com>
Source record: 167753

Re: Alternate mouses for the ST...

Both Best Electronics and Toad Computers should have replacement "native Atari" mice available, just plug and play. (The Best Mouse I've been using for the last 4 or 5 years has outlasted three "genuine" Atari mice..!)

Also you can use PC mice... There is a software driver distributed by DMC Publishing that allows you to use a standard Microsoft compatible serial mouse on the ST, and you can modify a PC buss mouse to work directly with no drivers needed. The text files detailing how to do the modifications should be available on Atari ftp sites... if not, I know we have them on CompuServe, and I could mail a copy out if needed.

Message-ID: <3mj31s$lbj@golem.wcc.govt.nz>
Source record: 167755

Well untill one of you come up with some of the better features
that UIS III has I am staying with it...

Like up to 4 columns of files, all otheres only have 1...!!!

29 File (user-definable) extension mask's, what do the otheres have 4..!!!

10 Directory user-definable paths..

Selectable display font..

Can find size of group of files/directories..

UIS III is not PD, its full Commercial, I don't even know if there is a Demo..

The other problem is most of the other File Selectors are writen in 'C' and
are very large like 170k, UIS III is only 34k and the ACC to call it is only
423 bytes.....

So can any one write a good File selector that is better than UIS III, not just
in one or 2 ways but all ways and works in all Atari resolutions.....

Message-ID: <D6z4GA.G4K@isltd.insignia.com>
Source record: 167757

Postscript is a programming language that lays down graphics. There is no guarantee that the text is in a deducable form. A more fruitful approach might be to run a PS interpreter either into an OCR system. Another would be to modify the 'show' operators to emit each text fragment with its x,y and length which could then be sorted and where possible merged (though that would be more difficult where kerning was used or the generating application had inaccurate character sizes).

> Art Trap Productions | arttrap@aol.net | 24 hours
> - 14.4K - No Fee
> ==

First of all, as others have said, there are newsgroups specifically designed for this sort of thing (try alt.test). No big deal, though.

More importantly, the reason you can't get your signature file to work out properly (which should be no more than *4* lines anyway, in accordance with the net rules of use) is because you are letting your text extend beyond 80 characters in width. Type about 75 characters or so and punch in a hard carriage return at the end of every line.

There are others in this newsgroup who could benefit from this advice, as well. ;-)

In a previous article, gs01tph@panther.Gsu.EDU (Tommi Pekka Hietavuo) wrote:

>But anyway, I'd like to know, whether the "real" MagicMac has a
>dramatically better program compatibility than the demo?

AFAIK, the demo and production version are identical except for the nag box and time limit imposed on you with the demo version. I have heard of a GFA patch in the works for MagiCMac but time will tell. Any others?

>Even software that runs on Falcon (which isn't a compatibility wonder,
>either) often fails on MagicMac.

From a sheer numbers standpoint, I don't think MagiCMac's compatibility score is very high. It's just that the software that does work seems to work very well indeed (Calamus SL, for example). If the software that you most frequently use is in the compatible group you will likely be quite pleased with MagiCMac. If not, you won't. Human nature prevails.

>Mac seems to hate me, anyway. It's a wonder, how _every damn day_ I
>use the Performa 660AVs or Quadras at GSU Computer Lab, those great
>programs get somehow stuck - crash, bang, boom!

Given that you've made it clear in this newsgroup how YOU hate Macs then you can't really blame the machines for feeling the same way about you. :) But seriously, millions of other Mac users do not experience the constant troubles you find in that computer lab (where machines are always screwed up, anyway) so don't assume your bad luck holds true for everyone. The single, easiest fix for most Mac ailments is to turn all the extensions off by rebooting with the shift key held down. My 660av is rock solid.

And as far as your continued complaints about PageMaker, I repeat what I said before... don't blame the software if the user doesn't understand how to use the hardware/software properly. PM 5.0 works great for me.

>Can't help it, but Calamus SL is superior to anything I've seen on Mac.

No argument there. But PageMaker works too... when you know how to use it.

>I never take seriously folks who ("knowing better..") come to me and
>say: Mac is THE real computer, for people who want REAL results.

I wouldn't take them seriously either, although in my experience, it's the PC users who tend to make the claim about using 'real' computers. :)

Interestingly, some of the most informed people I know are Atari users who also own Macintoshes... they appreciate the power and ease of use of the Mac but still appreciate just how good the 'Atari way' was (and is). In fact, GEnie has a topic area specifically for this group of people.

It's one of the most active discussion areas in the Mac roundtable, too (Page 605, Category 40, Topic 5... "Atari Refugees").

Hey, let's face it... I would have preferred a very fast 040 or PPC Atari platform but NOT if I had to pay $3,000-$4,000 to get it and certainly not in a shrinking market with too little software, support, etc. Given all that, the Mac is a viable alternative now that prices have come down and performance is up. MagiCMac just sweetens the pot. :)

All IMHO, of course.

Correct.

>Mind you the disks could allready be formated, try and format a Quantum
>drive, you can't, all you can do is to partition it...

That depends entirely on the formatter you're using. ICD-format won't format
them newer drives.

I do have formatted my Quantum LPS270S with SCSI-Tools, to get RIDD (Hiya
Chris ;-) of a couple of bad sectors.

>Most modern drives are now formated at the Factory and you can't format them

Even the SyQuest cartridges only need to be partitioned when they come out of
the box. Formatting isn't necessary.

If parity was enabled I doubt you would even get this far as the SCSI
"Identify" command would not be recognised.

AR> Does the CP30200 have parity permanently enabled?

Don't you have specs. for this thing? Are there any jumpers near the 50-way
socket labelled PE (parity enable). I have heard that some Connors have
parity enabled in firmware. Running BOOTFIX, which comes with the ICD
utils. is supposed to disable it.

My NEC CDR-37 CD-ROM used to give me that on boot if I had a CD in the drive (or maybe it was *without* a CD in the drive). The was with a MSTE and ICD AdSCSI+.

I've since sold the MSTE - and on the TT it just doesn't show up at all on booting (but works fine).

The CD-ROM has parity permanently disabled. Don't know about my boot drive - but as it was connected to a ICD MicroSCSI I suspect it was parity disabled also.

:-)

Roland.

664. Falcon + external SCSI

Newsgroup: comp.sys.atari.st

From: smoore@chowgar.demon.co.uk
Message-ID: <797736312snz@chowgar.demon.co.uk>
Source record: 167779

I've got an external SCSI hard disk here that I can't sell so I'm going to hook it up to my Falcon. I know I need a SCSI 2 cable (or would just plain SCSI do) to connect but how do I get the Falcon to recognise it ?

I've got ICD Pro utilities so I suppose something on there would do the trick but I'm hoping I won't have to mess about with the ADHI software I'm using for the internal IDE.

Any advice ???

Cheers.

: gram or not??? If you can answer any of these questions, please email me!

Geez,,, the number of times I have answered this question in this very
newsgroup must nearly be in triple figures! Surely it should be in the
FAQ... Do we even have a FAQ? Anyway, here goes again...

Modems support Fax classes 1,2,and 2.0. Your modem will support a
combination of these.
Fax software also supports a combination of these...

Most modems nowadays support classes 1 and 2, except USR modems which
support classes 1 and 2.0.

I have been doing a lot of research into this area recently...
Although there are others (StarFax, HackFax, BTFax etc.) the three worthy
of consideration are the following (IMO of course)

CoMa - Shareware, fully GEM Compliant, supports classes 2 and
2.0, imports TXT files and IMG files (and propietory FAX
files).
It also supports Voice capable modems and has a built in
FTP server, which is the simplest form of BBS. This is the
best but is very dear - about #50 pounds to register.

STraight Fax - Commercial, costing #80 pounds from System Solutions.
Supports Fax classes 1 and 2, imports TXT and IMG and comes
with drivers for most word processors and DTP packages
(E.g. Calamus, Pagestream, That's Write, Calligrapher etc.)

classes 1 and 2, imports TXT and IMG and comes
with drivers for most word processors and DTP packages
(E.g. Calamus, Pagestream, That's Write, Calligrapher etc.)

Junior Office - Shareware, originally German but I have just translated it
into English. It will be about #17 to register. It imports
TXT and IMG and allows you to freely combine them. It is
very GEM compliant and supports FAX classes 1 and 2.

] > Hi, can anyone recommend a good hard drive defragmenter...

In the commercial world, nothing (IMHO) beats Diamond Edge. As well
as de-fragmentation, it has a host of other data-saving features.

In the PD, something like Zorg (if you read German and have mono'
monitor) or Check-Disk 3 (chkdsk3) if you can find it, or DLII if you
can put up with the wait and bugs (Reorg is the de-fragging part of DLII,
and ain't the greatest....). ST-Tools is a horrendously slow, but
perfectly good program for defragging.

There was a french de-fragger released a few months back which wasn't
too bad, but I'm damned if I can remember the name of it.

Hunt around FTP sites for CHKDSK3.LZH/ARC/ZIP it's quick, simple and
does the job. It's also reasonably rare due to the hassle Atari
gave everyone due to the fact that only developers are/were supposed
to have it. But it _is_ on one of these FTP sites:

atari.archive.umich.edu
micros.hensa.ac.uk
ftp.cs.tu-berlin.de
ftp.uni-kl.de
ftp.cnam.fr

They're the only ones I use, and I saw it on one of them, look in
pub/atari or pub/micros/atari mostly.

It's best if the PC has a 16550c chip either in the modem, or on the
RS232 card, otherwise they tend to have difficulty at speeds above
38400 (e.g. 57600 and upwards). And if you're going to run a 14400 or
better modem on an ST, then this should be the kind of top speed the
hardware mod you put in should be capable of, as it _does_ make
quite a difference to speed when all you're transferring is text.

If you really want a good connection, buy an accelerator card to get
your ST up to 16Mhz or better, stick 4meg into it, sort out the serial
port so it can cope with 57600bps, then stick a 28800bps modem onto
it, then assuming your PPP/SLIP (or whatever) connection has a
v.34/v.FC modem on the other end, you'll get some pretty horrific
transfer speeds! (My 8Mhz STe is strained doing 19200bps, so I really
wouldn't trust it to handle 57600, hence the accelerator).

Of course, this is only usefil if you've got a spare $500 or so to
play with ;-) (Which I don't... :(

: Normally I would not condone downloading an illegally posted registered
: version of any shareware from an ftp site, but under the circumstances,
: being that Doug Harrison can apparently no longer be reached, has
: completely stopped improving or even supporting his software, and has
: screwed over many people (including myself) who have sent him money to get
: the registered version, I will use situational ethics to justify it in
: this case. If other people have comments about this please speak your
: mind but don't flame me.

I won't :-) Without knowing, why the author has quitted the
developement, I can't say much for or against him. Still, there are some
Atari programmers who have suddenly "jumped" to the PC or Mac side - and
after that jump, treated quite roughly their ex. Atari customers. It's
funny, how many people, after this Change (for the worse ;-?) completely
stop doing Atari stuff, begin talking about "business is business and
Atari is dead..", and - well, sometimes turn into complete assholes
otherwise, too.

Test yourselves: if you sometimes feel a pressure to shout out loud:
"Program makers are here to MAKE MONEY!!" - and hear strange messages
from nowhere, whispering about Windows 95 and Pentium Power - brother,
you're in some trouble ;-) !

I still wonder where the new NetHack for GEM is? Is that project one of
those "gottamakemoneyonPCbecauseatariisaloser-computer.." things?
Sacrified for a sexy Pentium Power Box? I really hope that this is not
the case..!

I can't forget the attitude of some programmers who have publicly here
stated that: "forget the Falcon games", and "why make an Atari version,
if you can get more bucks from PC-world..". Fortunately, there are still
people who think that money is NOT everything - and Atari is a fun
computer to use. We can see those damn fast, powerful and utterly
unuseable Windows P-90 wonders everywhere, use them at work, and use
those standard programs everybody uses. But isn't it great to come home -
and see a FRIENDLY computer on your desk, instead of a stupid business
beast? I may (some day..) buy a PC for games - but as a hobby... Never.
This is much more fun. And with Calamus SL, very productive too =-) !

TH

Long live "do what you want to do" !

CoMa is available in a demo version, which only sends about one-sixth of a page; still, useful for trying it out. Using it on my USR Sportster, I found that, though my faxes arrived OK, they finished with a time-out, rather than closing properly, when sent to some machines. I've not found out how to avoid that yet; it's a real problem, as one can't be quite sure that the fax has arrived safely.

Straight Fax sounds nice, but I would not get it until it supports class 2.0 properly; I don't think that has a demo version, though.

I am looking for a 1 meg (or better) ST system for a teen
center in NJ. I'd like to get both a color and mono monitor, 1040ST,
and maybe an external drive. A hard drive would be an extra bonus,
as well as a printer.

All I ask is this stuff works. This is not a scam, either.
Personally, I still owe someone from Ohio $50. This really is for
a teen center. I know there are people out there that have stuff
we can use sitting in their closet, and it would mean a lot. You'd
be dealing dirrectly with them, not me. I'm just getting info.

You can write it off your taxes as a charitable donation,
and probably make out all right.

I you have stuff and wanna sell it to the center REAL CHEAP,
we can work that out as well. Please e-mail me for any information.

Well, this may be one of the reasons why Atari is out of business. It was
the same when I bought my Mste. In sweden it was supposed to cost 17 000 sek
I imported it from germany and payed 10 500 sek. Unfortunately I screwed up
and had to pay "mehrwertsteuer" + "moms" (that is 2 * VAT) so it should have
been even cheeper if I had only known the trade laws.

684. Re: Degas Elite dile format

Newsgroup: comp.sys.atari.st
Date: 1995-04-13 00:00:00 UTC
From: JayCee@midmarsh.demon.co.uk
Message-ID: <892883080wnr@midmarsh.demon.co.uk>
Source record: 167799

In article: <3mbkka$kpm@cicg-communication.grenet.fr> nmonnet@grenet.fr (Nicolas Monnet) writes:

> Does someone know the format of compressed files .PC? ?
> (I already know those of .PI?, thanks)

Hi Nicholas, I tried to mail this but it bounced back to me :(

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control/data bytes
4 words left color animation limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag [0 = left, 1 = off, 2 =
right]
4 words 128 - animation channel delay in 1/60's of a second. [0 -
128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

< 32066 bytes total

Compression Scheme:

PackBits compression is used (see below). Each scan line is compressed
separately; i.e., all data for a given scan line appears before any data
for the next scan line. The scan lines are specified from top to bottom
(i.e., 0 is first). For each scan line, all the data for a given bit plane
appears before any data for the next higher order bit plane. Note that this
is identical to the IFF 'BODY' image data.
To clarify: The first data in the file will be the data for the lowest
order bit plane of scan line zero, followed by the data for the next higher
order bit plane of scan line zero, etc., until all bit planes have been
specified for scan line zero. The next data in the file will be the data
for the lowest order bit plane of scan line one, followed by the data for
the next higher order bit plane of scan line one, etc., until all bit planes
have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on
compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being decompressed.

o Whenever a control command is encountered, bytes are stuffed
in this buffer.

o The buffer is only emptied when there are EXACTLY 40
characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40
bytes in it. In other words, all control commands must end on
or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus
error when the picture is loaded.

This was lifted from a file named picformt.txt which details many of the
picture
formats used on the Atari - have fun.....

: I'm sure I missed some things (TAF Public Domain disk booth, etc). Mind
: you, this was only one room. I planned on returning the next day to see
: the MIDI room, but never made it. All in all, it was a very nice, upscale
: show (lots of nice monitors and systems that showed the programs).

The Gold Room held the likes of ICD, where Tom Harker was demoing two Jaguars networked playing Doom on the new Catbox (very nice). Also, Suzy B's Software was there, as well as Esquimalt Logic (OMEn), Steinberg, and a number of others. It wasn't as busy as the Burgundy Room, but that was liklely because it's a smaller room. I was disappointed at Atari's no-show at ACE, but all in all it was fairly good. I just wish Shawn Tedder (Scarboro Computers) would have shut up. :-) (He was the loudmouth over in the far corner to the left of the GEnie booth)

>What utter RUBISH....

Also applies to you :-) Software selection of the SCSI id *is* vendor
specific. The rest isn't (although some drives have vendor specific
extensions for the cache configuration).

>SCSI II Standards are clean...

But not necessarily enough.

>>And I have my doubts, that this drive will play a major role in the
>>Atari-world, and therefore it might be unlikely to see the arrival of
>>special versions of e. g. HDDRIVER or HuSHI.

If the drive is behaving like a properly designed SCSI device, it will
work without special support.

>apply textures, and from what I can tell (I don't know because I needed the HD
>space that POV was taking) it can also launch POV. If I remember correctly, it
>does work under MultiTOS, and it has a very nice 16 colour interface.

I tested it too (an got it working very well). To make it work, you'll have to
set the paths right from the menu "Parametrages" (show the .INC-files for colours
and textures you want to use etc.) - if you click off the "Mode Rapide" there,
you'll see the objects in 3d as they are (shadowed/dithered).
You can mode camera and it's focus point by mouse (in 2D-mode), and generally
edit all the POV 2 parameters! Also lights can be dragged around by mouse.

There's also Fractal Mountain generator, Bezier Object Generator, Spin/Extrude,
Constructive Solid Geometry editor etc., all in very well designed 3D-look
dialogs. There's also Animation Editor, but that gives an error (TOS error
66536, comes from wrong paths in the other parts of the program).
There's a 3D2 and Inshape object import, and it creates a nice commented
POV-script very fast.

General view is almost like in 3D Studio.
A great program!

There's the beta-version (scenes included don't load to the real version)
eb_edpov.tos, and the "real version" eb_edpov.lzh in ftp.cnam.fr
(pub/Atari/Graphics). You'll need also (at least) POV 2.0 binaries and
include-files).

Someone translate this great piece of software to English, please!

Bzzt, incorrect. You can format any drive as long as your formatting
software knows how to do so. You can even low level format an IDE drive,
though that would pretty much kill it.

I have the following Atari Computer for Sale:

Hardware:

Atari Mega STE 4
4 MB RAM
50 MB internal hard drive
Magnavox ICM135 14" Stereo Color Monitor
External DS(720K) Floppy Drive
Supra 2400 Baud external Modem
Beetle Mouse
Atari standard Mouse
Wico Joystick
3 2600 Joysticks

Software:

Pagestream
WordWriter
Word Flair II with FSM GDOS
Diamond Back II
various other utilities (Warp 9, look it, etc...)
plus MANY GAMES (Dungeon Master, Empire, Uninvited, etc...)

****
Everything is in MINT condition, and I have the original
manuals for the software/hardware, as well as the orginial
boxes for the hardware.

Shipping can be arranged. I would prefer US sales, payment
must be in US funds.

I am asking $800 or best offer for the whole package. Please
send me EMAIL at dogman@svpal.org if interested of if you have
an offer.

: Does Pagestream work under MagiC?c
: on the St?

Yes it does... Although it grabs whatever memory is available, thus precluding you from running further programs, and already running programs from requesting more memory.

And if you limit the memory available to it using LIMITMEM.TTP it will not run properly, stating "No memory available for FileSelector" when you try to open a file.

So basically the answer is yes.

BTW, how does LIMITMEM actually work? As the names of the programs it acts upon are not actually stored anywhere, I assume it must modify the executables themselves???

From: Peter_Missel@m4.maus.de
Message-ID: <199504141318.a47971@m4.maus.de>
Source record: 167678

>Most modern SCSI drives have their spects set internal and should
>tell the ICD software how to format the disks...

Right - granted that the Zip drives identifies as either a storage or optical media, any SCSI formatting tool should be able to format and partition.

>Mind you the disks could allready be formated, try and format a Quantum
>drive, you can't, all you can do is to partition it...
>Most modern drives are now formated at the Factory and you can't format
>them your self...

Nonsense, sorry. A SCSI device decides by itself what to do when receiving a FORMAT UNIT command. Some drives really format their surface, some are hard-sectored and just erase a few tracks (like newer Quantums do), some don't do anything at all. But the "FORMAT UNIT" command is mandatory, there is a defined set of answers to it. What the drive does between getting the request and answering it is its own problem.

bye, Peter

Yes, he -was- here (spoken with heavy emphasis on the 'was'). Can't your newsreader search back through previous articles of the last few days?

Dave seems to have this nasty habit of popping into the newsgroup or topic areas on GEnie, posting a message or two, and then disappearing again for several months. Methinks his mailbox probably explodes following one of these appearances (mostly with Spectre demands and questions) which forces him off until things cool off again. Can't blame him, actually.

Ah... the life of an Atari celebrity is not an easy one. ;-)

732. MacMagic, as bad as the demo?

Newsgroup: comp.sys.atari.st
Date: 1995-04-14 00:00:00 UTC
From: dhbutler@stat.mps.ohio-state.edu
Message-ID: <3mm3hd$kid@osustat.mps.ohio-state.edu>
Source record: 167688

Well, I finally downloaded the MacMagic demo and played around with it. It certainly is very fast, I'm running on a Powerbook 165c on an external monitor in 256 colors at 832 x 624 resolution (very nice), and it checks out as almost identical to a TT in speed, or even slightly faster in some cases. I managed to set it up to use Neodesk 4.0 instead of that EASE thing, so I have a decent desktop (no offence to EASE users, but Neodesk suits my needs much better).

Here's the problems; first, I currently only have 4megs ram in the powerbook, but will be upgrading soon. However, even with all extensions off, by the time MacMagic gets loaded I have only 1meg free ST ram! MemWatcher reports that I have 3384k total ST ram (or about that), but MacMagic takes a full two megs! Add Neodesk, and even in 16 colors instead of 256 I have only a meg left. Like I said, I'm going to upgrade, but does the final version of MacMagic really take two megs? Does the ST version of Magic take so much ram? I use Geneva on my ST, and that's extremely small. Anyway, I would like to be able to have a 10meg powerbook and not have to restart with extensions off everytime I want to run my ST software in order to make up for two megs of ram which seem to be dedicated to MacMagic.

Second, nothing seems to run on it. Now this is a problem. I've tried quite a bit of software, and I've had virtually no luck at all getting things to run. I can't get Calamus 1.09 to run, TouchUp does not work, the GemView package installer won't even work, Warp 9 does not work, Mouskamania's (how do you spell that?) AutoMouse does not work, The Speed of Light demo does not work, Wordup 3.0 does not work, the list just goes on and on. A few things did work, STZIP works, a little line-drawing program works, and NeoDesk 4.0 mostly works (the reorder function does not work, but most everything else seems to). The thing is that I don't know if these are Magic problems, or MacMagic problems, or if I just can't set anything correctly because it is all in German.

Is Magic this trouble prone? All the software I've tried works fine on my ST with 4megs ram, ISAC card, T25, Geneva, and NeoDesk, so I figured they would work on just about anything. Oh, actually, I have to turn Geneva off to use Wordup come to think of it.

Does Magic have a set of flags that can be set for each application like Geneva does? This was endlessly useful in getting certain apps to run under Geneva, and if Magic does not support this type of operation then it might not be useful to me.

Let's see, other things that failed were;

Xcontrol
Deskmanager 2.7
GEMBench (on float-math test only)

Anyone else have comments? Is this a problem with the demo only? Who else has these problems with MacMagic? Can anyone tell me of a software package that does function? It looks like a product with great potential, but if it is this buggy there is no way in hell I'm gonna buy it!

Thanks,

-David Butler

From: alfasoldt@aol.com
Message-ID: <3mm7c3$pva@newsbf02.news.aol.com>
Source record: 167690

Help! I bought MagiC 2.0 in the states and am trying to get it to work with ICD's hard drive software. The ICD software seems to trample on memory used by applications in some way. They can't find their RSC or config files, even when those files are in the same folder.

This does not happen when I switch to the AHDI driver. Most software behaves fine under the AHDI booter, although STalker gives me fits now and then by crashing at odd times. (It behaves fine under Geneva or SingleTOS.)

Anyone able to get MagiC and the ICD software to coexist?

And are there any guidelines for setting the four MiNT program flags under MagiC other than the explanation that comes with the MiNT docs?

The system is a TOS 1.04 1040ST with 4 megs.

Does the Twilight screen saver behave when alternate serial ports are in use? One reason I like Before Dawn is its way of running without interfering with Modem 2. TT Artist, which is otherwise a fine screen saver, clobbers Modem 2, as do many other screen savers.

> Can you please comment on these three items? Thanx!

Michael,

There are many good mouse accelerators. CKBD has one of the best, but I usually use SilkMouse. Screen savers? SilkMouse's is very competent, but for special effects Before Dawn is nice. Pinhead is available as a separate TSR called (oddly enough) Pinhead. It doesn't work with MagiC but works otherwise under SingleTOS and Geneva.

Al Fasoldt <alfasoldt@aol.com> wrote:
>> If anyone knows how to boot up MiNT in ST Hi on a TT let me know.
>
>You can set the resolution of a TT from the NEWDESK desktop or from
>alternate desktops.

Yes, but that does not work for MiNT. With MiNT, you never enter GEM, which never loads newdesk.inf, which never sets the resolution to ST high.

There is a program on atari.archive in the TT directory which claims to put a color TT into ST high during the boot time. I plan to try this tonight in order to run X.

What I would really like is a boot manager with does not use GEM and can select which TT rez to start up in. Superboot 8.1 is great, but it is not really TT resolution aware (It only likes ST modes, and doesn't allow ST high unless that happens to be the mode you are in. Besides, it doesn't allow you to switch resolutions).

If only someone would write simple programs to switch a TT into a certain resolutions. This would be similar to the programs for the MegaSTE which select diferent combos of the cache and CPU speed. Likewise there is a similar program which puts a regular ST into Med res during boot. You would have one program which sets TT med, one which sets TT low, one which sets ST high, etc.

Then, with the above res switching programs, it would be easy to set the resolution from any of the boot managers out there.

Am I way out in left field here? Does anyone else understand what is being asked for?

Bear with me since I finally got my TT and my monitor. I will probably have many questions for all you TT owners out there.

What are the overscan capabilities of the TT? I have an NEC multisync plus, and the TT color modes have quite a bit of white space around the edges, esp. on the right side where the white bar is about 2+ inches thick! ST hi is basically a small box on my screen with HUGE borders.

Any way to remedy this? I already have the knobs turned to maximize the picture on the tube.

To: gs01tph@panther.Gsu.EDU

On 12 Apr 95, Tommi Pekka Hietavuo shot this through the ether to All ...

TPH> Well, some people really don't like those who think different.. At
TPH> my home university, the local computer experts (Windows/Mac people)
TPH> almost shot me, after I told them we were going to make a magazine
TPH> using Atari, instead of their "real" computers. Some still don't talk
TPH> to me :-). Telling them: "Atari and Calamus just work better for our
TPH> project than Mac and PageMaker.." was like a personal insult towards
TPH> them. And also struck a "non-trustable Atari fanatic" label on us, who
TPH> didn't know what "REAL" computing is like =-) ! Oh, that wonderful
TPH> Windows world 8-) !!

Kiitos for the above Tommi! The main problem is that the majority of
these people have never bothered to look at the Atari machines because they
somehow find it beneath their dignity. Most Atari users stopped playing "my
computer is bigger than your computer" several years ago and simply got down to
getting on with it. I find that PC and Mac users (in general) actually know
less about how their platform works than Atari users do. They simply accept the
propaganda that gets handed down to them. I don't begrudge them liking their
machines. To each his own. What irritates me is when they put down my platform
without checking it out first. I think that they're afraid that they'll
discover that their opinins vis-a-vis Atari have been wrong all these years and
they really don't want to know.

Cheers,
Tom

ST> CoMa - Shareware, fully GEM Compliant, supports classes 2 and
ST> 2.0, imports TXT files and IMG files (and propietory FAX
ST> files).
ST> It also supports Voice capable modems and has a built in
ST> FTP server, which is the simplest form of BBS. This is the
ST> best but is very dear - about #50 pounds to register.

One should also point out that ?50 only registers the basic FAX program.
The voice upgrade is one additional fee and the FTP server is another. The cost
for the total package (CoMa PRO) runs to about ?150.

Q-Fax also works pretty well, the only shortcoming I've been able to
discover is that it doesn't appear to accept Modem2 on the Falcon. This is a
bit irritating as I'm running a 14k4/28k8 FAX/Modem which runs fine in all
other respects.

Ummm, have you used a modern Mac at all? I used to have an ST, but sold it after using a Mac for one hour. The Mac did everything that I wanted my Atari to do all along... multitasking (no arguments on this please, I don't care), cut and paste between apps, quality hardware that didn't break etc.

Perhaps the Mac is not the best music machine out there, but the hardware is up there with the best of the best. My Atari seemed to be an excersize on how to cut every possible corner. Every so often I had to grasp either side of the case and twist it back and forth to re-seat the ROMs.

Funny too, I quite liked the Mega ST.

> make me happy at all. And too many programs seem to have problems with

> it. It's as stupid as a cow. Easy, but stupid.

Why? What part of the Atari OS do you like better? I can find absolutely nothing in the Atari OS that does not exist in the Mac OS. On the other hand, I can find HUNDREDS of examples of the opposite.

752. Damn %$*! hard drives!

Newsgroup: comp.sys.atari.st
Date: 1995-04-15 00:00:00 UTC
From: Callum.Lerwick@flight.org
Message-ID: <896_9504150107@flight.org>
Source record: 167618

Hi! I'm new here, and I have a bit of a problem with some hard drives I just recently hooked up, this'll probably take a few interrigations, but I hope someone can help! I have three MFM hard drives hooked to two Xebec controller cards, which are in turn hooked up to an original ICD STHA SCSI host adapter, which is then plugged into an original 520ST (the ones with "wall wart" power supplies) upgraded to 1mb ram and TOS 1.0 in ROM, I'm using ICD utilites ver 6.0.7 fresh off CompuEvil, now two of the drives (a CDC wren 1 30mb drive, and a Segate ST-225 20mb) were preveously used with an Atari, I can use the partions on both drives, exept the C: partition on the CDC 30mb drive has a problem with its partiton data, and needs a reformat (thats where the problem lies, I'll get to that later), the third drive (another Segate ST-225 20mb) was preveously used on an MS-DOS machine and needs to be formatted for Atari. Now the problem: When I try to run ICDFMT, it starts up, scans for SCSI devices and says nothings connected! I click Rescan a few times, doesn't work! I really need to reformat all my drives! Help!

P.S. You *MUST* reply in personal Email! The crappy software Flightline is running keeps the last 1000 messages posted here, and there is no way to mark all of them at read, without actually going through and reading them all! And with the 30 minute time limit, there is now way I can read them all by having it mindlessly print them all out. <grumble, grumble>

<cue the blatant plug for flightline>

There is a 6.xx available, but this one ought to be fine for your purposes.

>My manual tells me that SCSI-tools do not
>support IDE, but the program does. I have one

Old manual of version 3.something ...

>disk installet already. I can partition the
>second IDE but not install it.

What exactly do you mean with "install"? You've obviously partitioned it, so
the jumpering (master/slave) should be fine. What happens after booting?

>Are there any other hard disk programs?

HDDRIVER might work for you as well. Dunno about ICD. IIRC, the 6.5.5 doesn't
support master/slave setups, either.

There is supposed to be a 6.6.x around, but I haven't seen it as of yet.

>What are the newest version of AHDI?

6.061, but it doesn't support two IDE drives, AFAIK.

Bye.

Dear David,

If you have something to say about MagicMAC, and not MacMagic, as you call it, be sure you know everything about it. You have probably got one of the first versions of the demo in your posession, and you are complaining that nothing works with it. Let me first explain how foolish you have made yourself by running patches on an operating system, like automouse, which patches things that are not there, MagicMAC is an operating system, not a TOS version. All good written software, which runs under MiNT, Geneva or Magic, are working perfectly with MagicMAC. We are currently selling the software, and we have had no complaints whatsoever. Let me give you an example of software that IS working with MagicMAC:

Papyrus Gold - does take 2 seconds to load + 2 seconds for loading the vectorfonts under SpeedoGdos 4.2

Cadans Cad - The Ship-drawing does take up 3 seconds to complete

QuickIndex 2.1 - Gives mostly results like 400% - 600% increase in speed, compared with a TT

And I can continue on and on and on...

People, MagicMAC is perfect for running serious software, like wordprocessors and other professional programs. It runs on a Performa 475/25Mhz at 7 times the speed of a TT!!! All good written GEM programs are working good, at incredible speeds. There is even an option to go back to your apple-environment and go on with your apple programs, and then switch back to the Atari.

MagicMAC is for sale in Holland at:

Paradox Computers
Oosterkerkstraat 18
2312 SN Leiden

Stop by for a demo!!!

With friendly regards,

Martin Molenaar, mss@xs4all.nl

760. Re: Dave Small... Nice to see you back

Source record: 167626

With reference to the Atari celebrity, whose mailbox quills over;
why can't Dave Small make a statement on the status of Specre 3.1,
i.e. answer the question *WHY* in almost 5 years time Spectre users who
paid good and much money for their product, still cannot access their
SCSI drive on the TT, still cannot use System 7 and so on....

IMO opinion it canot be of technical reason; why would it be otherwise
possible to have TWO Mac emulators with color, System, HD drive support
for the amiga and -despite the initila develomen advantage- none for
Atari cimputers?

As to his statements there seems to be a better Spectre version
available; why isn't it released....if he doesn't want to continue work
on it, why doesn't he release it into PD? Why did he lie to users in the
statements about the Soectre 3.1, i.e. in the AEO magazine where he
announced availability almost immediately.

And now this obscure competition (well, he seems to have time for it....)

No argument about the genie inside Dave Small. But he owes a large number
of people, who paid money for a functioning mac emulator and expecting
new versions, at least an explanation. To me, his behavior in that matter
just does not make any sense.

Regards,

Alfred

Hutch (hutch@ilmen.lanl.gov) wrote:
: In a previous article, gs01tph@panther.Gsu.EDU (Tommi Pekka Hietavuo) wrote:

: >Mac seems to hate me, anyway. It's a wonder, how _every damn day_ I
: >use the Performa 660AVs or Quadras at GSU Computer Lab, those great
: >programs get somehow stuck - crash, bang, boom!

: Given that you've made it clear in this newsgroup how YOU hate Macs then
: you can't really blame the machines for feeling the same way about you. :)

It seems like Macs are the first home computers that show real artificial intelligence ;-) ? I wouldn't, btw. say I "hate" Macs. I just criticize some things most people never criticize... Haven't you seen how critical lot we Atarians are: always bashing our own stuff with hammers? Why shouldn't we be critical towards other computers, too =-) ??

And, really: in computer world, there are pretty many things nobody criticizes, though everybody should. One such thing was Windows 3 when it appeared. If someone spoke out one bad word, the Believers of Win 3 usually got red, and exploded to your face! I know, there are people like that in every group - also among Atari users. But some Mac owners have surprised me, too - by being so high above "us mortals, using second class computers like Atari"... I mean people who can say: DO NOT criticize Mac's File Selector - IT IS PERFECT!!! After using UIS3 or Selectric, that thing hardly is perfect - do you agree? Some things you just have to criticize.

: But seriously, millions of other Mac users do not experience the constant
: troubles you find in that computer lab (where machines are always screwed
: up, anyway) so don't assume your bad luck holds true for everyone. The
: single, easiest fix for most Mac ailments is to turn all the extensions
: off by rebooting with the shift key held down. My 660av is rock solid.

Well, as seriously: I'm not at all the only one who has experienced such problems. And our Macs here don't use many extensions. Dark Side is there, but not much more.

: And as far as your continued complaints about PageMaker, I repeat what
: I said before... don't blame the software if the user doesn't understand
: how to use the hardware/software properly. PM 5.0 works great for me.

Wasn't that pretty much said - since you know nothing about my skills (or lack of them..) using PageMaker ? I'm sorry, but that's the attitude in many Mac users that I hate: they think that if somebody (PC, Amiga or Atari user) doesn't get the results he expects from a Mac program, it's always the USER who has been stupid..?

: >Can't help it, but Calamus SL is superior to anything I've seen on Mac.

: No argument there. But PageMaker works too... when you know how to use it.

So I don't, I guess..? What kind of an attitude is that? Is every Atari owner an idiot when using Mac and PM? Or am I the only idiot among (otherwise very Mac-honoring) Atari users..??

No, you can't say like that - to someone you don't know, can you? The fact is, that if a program is WYSIWYG (like PM is, afaik) - then, if something is o.k. on screen, it should very much look the same when printed, too. Do you disagree?

But this is what happened: I placed a headline text on its place, making sure that kerning is correct. When the headline looked good (I checked it many times, using different magnifications), I made a test print. And now the letters that WERE correctly spaced on screen, were not that anymore on paper! The printer was Apple LaserWriter 2. The kerning was just awful: some letters didn't have any space between them at all, and some did too much. If I was the "stupid Atarian who hates Macs", can you please tell me, what it was I did "wrong" ? Especially, when I haven't experienced any similar problems with PC PageMaker... With Mac PM I've had this kerning bug twice, on different machines and setups.

Let's face it: this wasn't my own fault. I know PM well enough to know that. This problem was related to differences between Postscript printing and PM's own screen rasterizing routines. The same font behaved differentely while printing than it did on screen. This isn't rare using Postscript, at all! And this is one of the reasons why Calamus was developed. The coders of Calamus had had enough of problems like this... So, they developed a page descripting language of their own which would always create absolutely similar results on screen and on print. I think, they succeeded very well with that.

: >I never take seriously folks who ("knowing better..") come to me and
: >say: Mac is THE real computer, for people who want REAL results.

: I wouldn't take them seriously either, although in my experience, it's
: the PC users who tend to make the claim about using 'real' computers. :)

I agree on that.

: Hey, let's face it... I would have preferred a very fast 040 or PPC
: Atari platform but NOT if I had to pay $3,000-$4,000 to get it and
: certainly not in a shrinking market with too little software, support,
: etc. Given all that, the Mac is a viable alternative now that prices
: have come down and performance is up. MagiCMac just sweetens the pot. :)

It's good that we still have some choices, isn't it?

: All IMHO, of course.

Of course :-)

Thanks. I actually just figured it out this morning. I tried allocating more
and more RAM to it, but I was still getting error messages. Than I thought about jumping down to 256 colors. I did that, and then the MagiCMAC demo WORKED!!! WOW!! This is impressive!

Now, my question is, is the full commercial product that is being imported into
the US, will it have ENGLISH resources? Seeing german in all the drop down menus is a little worrisome.

Hi, I've got into a right mess since installing X-Boot.

I've got NeoDesk4, Geneva and Mag!x. Why won't Neodesk4 automatically load after Geneva or Mag!x ?

I've got my boot setups all mangled and it's going haywire !

With my Geneva/Neodesk combination, Geneva loads OK, but Neodesk4 won't start automatically. The same with Mag!x, Neodesk won't start.

Say I want to have several combinations like Mag!x without Neodesk, Geneva with Teradesk, Neodesk on its own, etc etc, how can I set this up in X-Boot ?

I know this should be obvious to me, but my brain just died from trying too much :-)

Thanks in advance,

Kev.

I have a puzzling scenario: I have gotten Linux and X Window up and running on a Quantum 240S (with much help.) However, when I tried to copy the stuff over to a Quantum 105S-- wierd things happen: the file size shirnks and I get some serious file system errors.

I formatted the drive under AHDI 5.x (same way I did with the 240S) and partitioned with enough space for my data.

This Q105S was my primary HD until I got my new Quantum Ligthning 540S and I had no problems with it (under TOS.)

Any comments?

Also, I cannot run the xc program -- it keeps telling me that it cannot open device /dev/cua0. It has major number 5 and minor of 64. IT will also not work witj ttyS0 and I don't have the modem device in /dev.

Hi, I have a Mega 2 ST, with 3, 40+ meg HD (love it too!) 1's a SCSI Quantum, 2, Seagate ST251, 3, Priam 1D45 ? H With an adaptec controler and a ICD Host adapter with a clock, Yes, I got all 3 to work but the controler can handle 4 MFM's and I can't get ICD to see more than 2 MFM drives.
The wide ribion has a twist on the last HD (priam) I put a 3rd conector in the wide ribbon and set the 2nd Seagate to D #3 added a 3rd narrow ribbon but if I have the Priam conected it dosn't see drive 3 or 4, but with one or the other it does....???? it see's that the priam is 1,2 or the seagate as 1,3 but not both???

While I'm here, I'm using Flash 2,21E, what would be better for neting. and Flash on capturing large BBS confrences has gaps in the txt, Storm has bigger gaps tho. I've tryed different settings on my LineLink 144e. I get carrer lost many times too.

I'd also like to get a GIF viewer that works on all picture files or close to it, I have DMJ 3, but it locks up on many GIF. but none of my older stuff work either. I want to make animated cartoons. for kid as well as adult ones for me:-)

Any sugestions?? I have a VIDI-ST any newer prg's for it? I can capture about 45 frames, but its hard to work with coloring each frame.

thanks.

I must be thinking of some other patch program I used to use with my older
TOS 1.04 system, then... For some reason I was under the impression that
PinHead didn't work on the Falcon? Hmmmm. I wonder if I'm suffering mental
crossed clusters, perhaps I'm thinking of PoolFix4.

I really liked the fact that Warp9 applied all these patches into one program,
adjustable with only one .ACC; still it's looking to me as if I will be making
the switch to NVDI soon, too.

I have the following for sale. I hope the prices are low enough, but anyway
you're welcome to negotiate. Postage goes on top. Can be as high as 12-18 DM
for air mail to the US, so beware... (1US$ ~ DM 1.40 as of today)

SOFTWARE (original disks, updateable, etc...)
----

o Lattice C 3.03.04 (old, but working, inc. documentation), DM 40.-

o Omikron Basic 3.00 with book, DM 10.-

o GFA Basic Interpreter and Compiler 2.02a with book, DM 20.-

o MultiTeX 5.1 (Maxon-Sonderdisks), DM 30.- (you can update those for 20.-
to version 5.4, which costs DM 75.- on it's own !)

o Flexdisk (flexible, reset-resistant Ramdisk, this version works
with TOS <= 1.04, inc. book), DM 10.-

o TOS-Disk 12/92 (inc. Tempus Word Junior), DM 5.-

o Calligrapher Demo Disks - free with any other purchase

BOOKS
-----

o Diskus Version 2.7 (w/o binder, just the pages, german) DM 5.-

o DB Atari ST Intern (german), DM 5.-

o DB C-Knowhow Laser-Megamax-Turbo (german), DM 10.-

o microware OS-9 ringbook in case, User's manual for their
C and Fortran-compilers. Nice C-Reference., DM 10.-

o Handbuch MicroTalk-Mailbox (nette Einfuehrung ins FNet), inc. Disk, DM 10.-
ist auch 'ne gute Doku fuer DFU-Einsteiger, mit kleinem Terminalprogramm.

neptune@galaxy.teuto.de "Hendrik Mylius" writes:

:
:
: I'll beleive that when it's THERE. Not a bloody second earlier.
: <remainder edited out for brevity>

This is one of the main reasons that set me into buying a Mac. GE Soft, the MagiC! team, ASH, and so many others seem to have fallen into the classic Atari trap. Devise a bloody good idea, do a feasibility study and if that comes up with a better than even chaance of success, announce it to the world as "imminent" When it doesn't appear, because it wasn't that easy, find "hardware incompatibilities", "inconsistent system faults", or any other technical bullshit you can think of to blame the delay on. With any luck, by the time you get the project completed, there'll be no-one left to sell it to anyway.

I've seen and heard talk of the Eagle, the Medusa, MagiC3 et al for ages, but NOTHING has appeared. (sorry, one or two demo machines and systems have been shown halfway across the world) IF the Eagle had come up at a reasonable price, I'd have bought one; it didn't, so I got the next best thing, a Macintosh. As far as I can see, it will do almost everything a Falcon can, and more. I can put MagicMac into it to run "clean" Atari software, I can fit a 486 board for PC rubbish if I REALLY have to, and I can upgrade it to PowerPC as needed. What more do I need? (apart from a new printer :-))
I would have much preferred to stay with Atari. I've always thought that in concept they were so much better than the rest. However, the realisation, the marketing, the backup, and the service were crap. The Mac and the PC succeeded because the public saw them as *Computers* (box of electronics, separate keyboard). The Atari seemed to be a glorified Spectrum. All in one box and why can't I plug it into the telly? The fact that at launch time it knocked the PC and the Mac sideways technically didn't matter. The impression was that it was a game console with a keyboard. The Mac got developed continuously, so did the PC and what did we get? The TT which tried to do too much and was too expensive and too late, then after ages and ages, the STe. Wow! No wonder they went down. The STe, if we are honest, didn't even match what the Amiga could already do.
Now the Falcon has arrived (in the same clothes) and passed (for the same reason) and we're STILL crying about it.
I'm going to keep my ST if the finances will let me. It's still a damned good computer, still easier than the Mac. It's just not quite good enough today.

Probably the wrong place to have said all this, and I apologise for that. It finally got to me is all.

Time for me to commit CyberSuicide $-)

The chances of a Doom-clone anything close running on the STe seem remote...

..is it really possible to do the texture mapping?

Something with the old-style 3D objects would work like Interphase...

..but surely not on the scale of Doom?

On the Amiga, haven't they had to make the minimum config a 1200 (ie 020)...

..to get it fast enough?

Sorry about this! I love my ST for usability, etc, but had to buy a 1200...

..because I do like to play games and the ST just can't keep up anymore.

Or is it just lack of development leaving it way behind?

789. WTB: DA's Layout CD - English

Newsgroup: comp.sys.atari.st
Date: 1995-04-16 00:00:00 UTC
From: mtaylor@perth.DIALix.oz.au
Message-ID: <3mqj23$8et$1@perth.DIALix.oz.au>
Source record: 167562

Hello to all,

Well if anyone has the latest version of Digital Arts Layout CD DTP software with English menus etc for sale I am interested. I have been trying to upgrade my Didot Pro B&W for quite sometime to this but DA's Germany give me the complete runaround for the last 12 months or so. I do not need a manual so any German users might be able to help. I beleive the version released in Germany has various languages available from a pop up menu to convert the menus and help messages. This software is very good but the support offered by the UK distributor CGS Computerbild and the author company Digital Arts in Germany could only be fairly described as abysmal. So be warned if dealing with these companies as I have got the runaround from them for the last 12 months or so promising upgrades and it has cost me several thousands of dollars in lost work and costly delays to my customers.

Well if you can help me out please let me know. If there are any other disgruntled users of DA's software out there then how about letting us all know and we might save everybody else a lot of heartache.

Best regards from OZ
Mark

'525 v2.0x' handles WAV and AIFF. Converting it to RAW could perhaps do
it. Any idea how the SoundDesigner format looks like?

I don't know if MagicMac has some switched to make it more compatible for
'not 100% clean' GEM software, but EASE has some things to hel you.
The most important thing is, that you can start any appalication in
'single mode' - which behaves like TOS, not MultiTOS. So some programs
that don't redraw the screen correctly for example work.

794. My newish PM6100...

Newsgroup: comp.sys.atari.st
Date: 1995-04-16 00:00:00 UTC
From: kwd9152@is2.nyu.edu
Message-ID: <3mr01j$81l@cmcl2.NYU.EDU>
Source record: 167567

I purchased a Powermac 6100/66/DOS machine after a decade using Atari's, starting with the 8-bit series.

I shared some of my greatest experiences using the Atari's. I don't know where I'd be now if I hadn't used Atariwriter on cartridge. :) I gained a lot of problem solving skills on the 8-bit... :)

On the Mega ST, I first hooked up with BBSes... and with my Mega STe, I went to college and hooked up with the internet. After all of these years, I just found that the MegaSTe really couldn't stand up to the current hardware available and found myself at a crossroads... It was once again time to upgrade. All instincts were pointing towards the Falcon...

...but logic told me that the 030 was outdated already... and the PPC was the future of non-Intel-compatible based computers out there. If I bought a Falcon or a TT, I'd continue to be the butt of "Atari 2600" humor... and for another 4 years(or however many I'd continue using it), I'd be locked in my own software-dead world.

My ultimate decision was to get the PowerMac 6100/66/DOS compatible package. I worked in a Mac-based computer lab for a semester, and learned a lot about Macs. They offered more ease of use than the PC(obviously) and actually, even more than the ST! Everything about the Mac feels professional. It didn't feel like playing with a toy. I finally can view pictures in MORE than 256 colors(on my ST...well, it took hours viewing gifs, and days viewing JPGS) :)... Ah, glorious color. :)

16-bit audio with sampling facilities built in doesn't hurt either. Neither does a CD-rom player with actual CDroms available for it. :) I always wondered what the point of having one for the ST was...

Before I owned the computer, I wondered why I'd need 16 megs of ram. Now I know... in order to run more powerful applications, you need more ram. Well... a lot of the software I now use is really a lot more powerful! I couldn't even imagine a Photoshop equivalent running on the ST/TT. I guess it could be possible on the Falcon, but not on anything else w/o expensive non-standard graphics cards.

One of the great things I can now take advantage of is ETHERNET via my dorm. The speed is simply marvelous. Programs like Telnet, Fetch, Anarchie, and Netscape make everything worth it(ah, the WWW). Plug'n'Play PPP access is also great(before I got etherneted). Everything looks like it's been planned out and feels professionally made

The point is that I could have chosen to get another Atari, a company that hasn't rewarded us with anything in years. They make fine machines, but over the years they provided little in the way of support for their hardware. I still wonder why they never just used clone-style cases for their computers. They always had to be a little weird, and thus the TT/MegaSTe case was born, which was practically as cramped inside as the standard one piece case. :)

Only the diehard hackers and wanna-be hackers are still using the STs. :) Perhaps there are also some musicians who don't know any better using their STs. :)
A lot of this talk about mint escapes the average human being...and even those who are technically inclined have problems setting it up! Some might say, "why not just use a PC?" :) Sure, there are those who program for the sake of accomplishing something, but other than a pat on the back, you're not going to get rewarded. however, stick with it if you're having fun. :)

Well... I don't know if Atari is working on any new hardware, but I definitely think they should consider developing a new version of TOS that would work on the upcoming PowerPC multiOS-platform that Motorola/IBM/Apple have been collaborating on to combat Intel's monarchy(Anarchy, imho)...

I don't know if I made a point or not, but just remember that if you're on an ST with under a meg and without a hard drive, you're really missing out on a lot!... you're simply not... INTERNET capable. :)

Really. :) SLIP/PPP can change your life. You need to be able view GIFs/JPGS, and play with the WWW the way it was MEANT to be used! You need modem speeds over 19.2k! you need CDroms... and software compatibility! Ah, NETSCAPE! AH... You need magazines to look at. :)

One last thing... you need CUSeeMe. Video Conferencing over the internet... and it can't be done with an ST. Low end machines simply don't have the power.

Basically... if you're running on a 68000 processor, really, it's time to upgrade(unless you're just doing Midi). :) For under $1000, you could own a Performa 475, based on an 040... you'd need to spend another $320 for a total of 12 megs of ram, though...

For around the same price, you could get a decent 486/66 system if you want to choose the harder route of adjusting. Of course you could still take all your old software with you if you buy the GEMulator.

Don't fight the funk. Walk away... and that's my word for today.

>(the reorder function does not work, but most everything else seems to). The
>thing is that I don't know if these are Magic problems, or MacMagic problems,
>or if I just can't set anything correctly because it is all in German.

These are either demo problems or software problems. Of the programs you mentioned, Gemview e.g. should run.

>Is Magic this trouble prone? All the software I've tried works fine on my ST
>with 4megs ram, ISAC card, T25, Geneva, and NeoDesk, so I figured they would
>work on just about anything. Oh, actually, I have to turn Geneva off to use
>Wordup come to think of it.

Everything running under MultiTOS and on a graphics board should run under MagicMac without any limits (except for dongled software and programs relying on special hardware presence). The 640*400 b/w mode should make some dirty programs make run, additionally.

>Let's see, other things that failed were;
>
>Xcontrol

Should run, except for certain .CPXes (see above).

>Deskmanager 2.7
>GEMBench (on float-math test only)

040/040LC? No wonder, then. The float math test expects a 68881/68882,
AFAIK.

>because the xcontrol.acc is exited at the same time, too.

I'll try to change the boot -order of the .ACC's and .CPX's, if it would
help. The problem is still there.

>Btw: You don't have grey as color 9? Doesn't that look strange in 3D
>mode?

I'm into more pastel-color shades - with careful testing you can make
the Falcon look quite elegant, and still keep the 3D-effect.
My old no.9 was R706 G730 B761.

BTW, I found one drag&drop Wav-player: PLWAV100.ZIP from Hensa. It's
only fault it that it looses the desktop while playing the sound.

No, but the point is X-win runs before GEM is initialized - as called
from Mint in the AUTO folder. All standard methods of setting rez
happen when GEM is initialized, ie too late for the Xwindows boot up.

We need a rez selector that happens from the auto folder when the compter
boots up (or from a floppy bootsector before the hard disk is booted).

: I can get a Full Pentium for that price and with CD Rom and with Monitor..

Who wants a Pentium instead of a Falcon ;-) ? I don't. My friends don't. Few Atari users would. And why? Simply, because Falcon is a better (not faster) computer. Better for _us_, that is. And that's what counts.

Would you buy a Russian Tshaika car instead of (less powerful, and still more expensive..) Toyota Camry? The Tshaika surely has a big V8 (Pentium), lots of accessories and luxury, and so on. Argue, if you want to - but I think, for most of us, buying a PC for its popularity, speed, and such things, would be just as stupid deed. If PC's "way of doing things" felt right to me, I'd buy one. It's simple. But Atari feels better in my hands. I won't buy shit just because ten trillion flies "can't be wrong" ;-) ! And I think that many of you share this feeling.

I wish that C-Lab Falcon would be cheaper (perhaps it will be, some day) - and especially that its accessories, accelerators, etc. would be affordable for all of us. But even as it is, it's a good computer.

: And for a outdated machine and a Buged OS who are you trying to kid...

Do you speak of Falcon, or PC :-) ?

```
Atari Falcon 030 w/
85 Mb Internal IDE HD
4Mb Ram
VGA Adaptor
VGA/RGB Switchbox (home-made)
ScreenBlaster II
All Original Bundled Software (SpeedoGdos, AtariWorks, etc.)
All Original Manuals, Boxes, Mouse, etc.

I currently have a 16 meg RAM upgrade installed (single 16meg SIMM type)
which is also available with the system or separately.

Also available is a LOAD of software, which I'll throw in for good measure.
AND, I'll throw in BEST Electronics' TT-Touch keyboard upgrade and
whatever else I can find. ;)

SO, interested parties can contact me via E-mail with offers. I don't
know what the value of the system is; I do know that the current retail
prices are STILL OUTRAGEOUS. So, make an offer and we'll go from there...

set@hollywood.cinenet.net

Kevan Winch (kevan@empyr.dircon.co.uk) wrote:
: Hi, I've got into a right mess since installing X-Boot.
: I've got NeoDesk4, Geneva and Mag!x. Why won't Neodesk4 automatically
: load after Geneva or Mag!x ?

In order to have NeoDesk run automatically from Geneva, you should use the GEM.CNF file method, rather than having XBoot autorun it. You can either re-run the INSTALL.PRG that comes with Geneva or add the line:

shell c:\neodesk4\neodesk.exe

to GEM.CNF.

In order to use NeoDesk as the shell with MagiX, you need to add the _SHL line to MAGIC.CNF (I think that's the name of the file), as described in the README file that comes with Geneva.

: Say I want to have several combinations like Mag!x without Neodesk,
: Geneva with Teradesk, Neodesk on its own, etc etc, how can I set this up
: in X-Boot ?

To get this advanced, you would probably have to have XBoot control different GEM.CNF or MAGIC.CNF files, by defining these as one of the unused "info files" (similar to what XBoot does now for your DESKTOP/NEWDESK.INF.) Either that, or you can use the batch commands to copy a file over to the appropriate info file in each of your SETs.

: Thanks in advance,
: Kev.

: once again time to upgrade. All instincts were pointing towards the
: Falcon...

: ...but logic told me that the 030 was outdated already... and the PPC was
: the future of non-Intel-compatible based computers out there. If I

What does it matter, if 030 is outdated - if it works? As most people admit (those, who have used both Ataris, Macs and PCs), Atari OS doesn't require nearly as much horsepower as Mac's System 7.x or PC's Windows does. You can use Calamus SL on a 8 MHz, 4 Mb ST quite well (I know, becouse at my home university the school magazine is done like that..). But try the same on Mac Plus, PageMaker and System 7? No hope. Or PageMaker on a 386-16MHz/4Mb? Ridiculously slow.

I just can't understand, why so many people out there just look at some _numbers_ ("030 is outdated, so Falcon is too..) instead of the true performance of the system... My Falcon runs Calamus SL as fast as any 486 PC runs PM or Ventura - or a 68040 Mac runs whatever publishing software. This is no surprise to TT-users, who know it's true. Neither is it any surprise to Falcon-owners. TOS is superior in speed compared to System 7. So, what does it help if you get a faster computer - if a heavy operating system makes your software run just as fast or slowly as before? Macs file operations, e.g. are hopelessly slow compared to a simple 520ST with TOS 1.4.

: My ultimate decision was to get the PowerMac 6100/66/DOS compatible
: package. I worked in a Mac-based computer lab for a semester, and
: learned a lot about Macs. They offered more ease of use than the
: PC(obviously) and actually, even more than the ST! Everything about the
: Mac feels professional. It didn't feel like playing with a toy. I

Here I must strongly disagree. The more I've used Macs, the less I like them. As most people tend to think that I'm the one of us who's biased, I'll have to tell you, why:

I like to have control over my computer and its programs. Mac "thinks" a lot for its user; does lots of things without warning you, or at least without giving you much or any alternatives. Those decisions Mac does, aren't always, or even very often the ones I'd have done myself. Is Mac smarter than me, then? Maybe. Some of you may think so. I blame the extreme simplifying of everything; it makes a computer easy to use, but at the same time limits you. I'm happy that you like System 7 - but for my taste it's far too slow and limiting. It has its nice sides, too - can't argue that!

Despite that some of you never understand what I mean (because you think in other way, and have different ideas of using computer), I too often find myself cursing: "this machine is STUPID!!!". Well, sometimes I'm that too (who isn't?) - but honestly, I haven't got that feeling ever using TT, Falcon, or other Atari models.

I hope you understand this point of view, instead of thinking that I just love to be biased and nasty towards you Mac-users =-). I don't. There are some people around who think that "now, when Atari is dead, we all should upgrade to the next, logical alternative: Mac!". Those people seem to think that it's only natural to like Mac at least as much as one liked his or hers Atari. Everybody loves Mac, some people think! And if somebody doesn't like it, he's a bit dim, envious, or just queer ;-) ! That all is nonsense. We speak of two very different computers. Mac is better than Atari in many aspects. But so is Atari better than Mac in as many. Neither is superior to another as whole. I think, everybody should use whatever one loves to use. Especially, when Atari community is quite far from dead... There are lots of great programs available, CD-ROMs, etc. What else do we need? Pentium-Falcon for power freaks ?

: finally can view pictures in MORE than 256 colors(on my ST...well, it
: took hours viewing gifs, and days viewing JPGS) :)... Ah, glorious
: color. :)

Falcon isn't bad at that, either. With DSP especially JPEG-pictures load in seconds. I don't think it's fair to compare ST and 6100 today ;-) ?

: 16-bit audio with sampling facilities built in doesn't hurt either.
: I know... in order to run more powerful applications, you need more ram.
: Well... a lot of the software I now use is really a lot more powerful!
: I couldn't even imagine a Photoshop equivalent running on the ST/TT. I
: guess it could be possible on the Falcon, but not on anything else w/o
: expensive non-standard graphics cards.

I guess you haven't used Chagall, DA's Picture, or Calamus SL lately? And where are Mac-equivalents to Selectric, E-Copy, STalker, or Apex Media?

: Only the diehard hackers and wanna-be hackers are still using the STs.
: :) Perhaps there are also some musicians who don't know any better using
: their STs. :)

Aren't you a bit *too* proud of your PowerMac ;-) ? I'm glad that you're so satisfied with your computer. But so am I with mine; I guess neither of us would exchange computers with each other. And why should we? Well, I'm not a musician (at least, not now) - and wouldn't consider myself as a hacker, either. And I don't think you use a "better" computer ! Just different, and a good one.

: Well... I don't know if Atari is working on any new hardware, but I
: definitely think they should consider developing a new version of TOS
: that would work on the upcoming PowerPC multiOS-platform that
: Motorola/IBM/Apple have been collaborating on to combat Intel's
: monarchy(Anarchy, imho)...

Not a bad idea.

: I don't know if I made a point or not, but just remember that if you're
: on an ST with under a meg and without a hard drive, you're really missing
: out on a lot!... you're simply not... INTERNET capable. :)

You're right! That's why the solution is... Falcon ;-) !

: One last thing... you need CUSeeMe. Video Conferencing over the
: internet... and it can't be done with an ST. Low end machines simply
: don't have the power.

And most Macs don't have a DSP, nor a Blitter.

: Basically... if you're running on a 68000 processor, really, it's time to
: upgrade(unless you're just doing Midi). :) For under $1000, you could
: own a Performa 475, based on an 040... you'd need to spend another $320
: for a total of 12 megs of ram, though...

Please! I enjoy using Falcon - and get frustrated using Macs. So, unless
I'm stupid and biased person, there's no point in changing your living
workhorse. And when you do, the best alternative for most Atarians might
be Falcon. It's as fun as an ST, but much more powerful.

: For around the same price, you could get a decent 486/66 system if you
: want to choose the harder route of adjusting. Of course you could still
: take all your old software with you if you buy the GEMulator.

That sounds already pretty desperate. PC is good for gaming, but... Well,
I won't say more !

: Don't fight the funk. Walk away... and that's my word for today.

...And after a second thought: why not stay ?
You might face a brighter day !
;-)

Greetings,

TH

Okay - my docs say 16550a - but having tried a generic '16550' enhanced
IO card - it seems that these work fine. Whatever is pretending to be the
16550a/c is in one of the custom chips.

> RS232 card, otherwise they tend to have difficulty at speeds above

115200 seems to work fine for me.

> 38400 (e.g. 57600 and upwards). And if you're going to run a 14400
> or better modem on an ST, then this should be the kind of top speed

> quite a difference to speed when all you're transferring is text.

Not sure how easy it is to do a 57600 mod for an ST. 38400 is apparently pretty
simple. TTs, Falcons and MSTEs can cope anyway.

:-)

Roland.

815. Sacramento Atari Expo

Newsgroup: comp.sys.atari.st
Date: 1995-04-16 00:00:00 UTC
From: szhays@bullwinkle.ucdavis.edu
Message-ID: <3ms2at$9gq@mark.ucdavis.edu>
Source record: 167588

13 April, 1995

For immediate release:

Event: Third annual Sacramento Atari Computer Exposition.
To be held at the Towe Ford Museum of Automotive History: 2200
Front Street, Sacramento, California. 916-442-6802.

10am-6pm, $5 at the door.

Sacramento's Total Atari Resource (STAR), and the Yolo Atari
Club (YAC) proudly present SAC Expo'95. This years show will
benefit the Towe Ford Museum, without whom the entire event
would not have been possible. We greatly appreciate the
support and enthusiasm the Museum has given our effort.

Who's coming to SAC Expo'95?

Gribnif Software, STeve's Software, A&D Software/ST Informer,
Compo Software, Dr. Software, Oregon Research, Branch Always
Software, Toad Computers (STraight Fax), Shockwave Multi-Media
Productions, Chro-Magic, Dom Alvear (Computer Consultant),
Redding Atari Computer Enthusiasts, Diablo Atari
Computer Enthusiasts, Northern California Atari Computer
Enthusiasts, San Leandro Computer Club, Atari Bay Area Computer
Users Society and more to be announced later.

Come see the latest in new Software for your Atari as well as
new Jaguar titles and possibly hardware. Meet developers and
tour the Towe's fabulous collection of restored antique
automobiles. Hear Dave Moreno play a few tunes on the Museum's
Mighty Wurlitzer, and above all have fun!

At 8pm, everyone is invited to the Round Table Pizza Parlour at
127 K Street in Old Town Sacramento for a BYO pizza party.

See you in Sacramento on April 22nd!

Nick Langdon
STAR SAC Expo Coordinator
N.LANGDON4@GENIE.COM

> connector, Mac and PC versions from what I have read....

It seems likely that the PC version will come with a cable that goes from a DB-25 to a Centronics-style SCSI connector. Why couldn't you use this to connect to the Link (and either plug the Link directly into the back of the ST, or use a DMA cable to connect to the ST)? This would be a bit connector-heavy, but it should work if one keeps to the SCSI length limits. Also, Iomega will be coming out with an internal version if the external version takes off, which should have a standard internal SCSI connector (I hope they pick something other than purple for the color, too).

Incidentally, based on my experience with removable platter devices, it is very likely that the Iomega unit will work just fine if you fire it up with a cartridge in it, and never pop it out while the machine is up. The system will just treat it like any fixed-disk drive. However, I think the sense codes by which the eject and reready actions (therefore signaling a reread of the partition and other important info on the cartridge) are reported are vendor-specific. Thus, it seems probable that changes to the ST driver software would be needed to allow one to switch carts on the fly with this new drive (Unless perhaps they standardized on the Syquest codes?!?).

I have never seen any mention of someone using the older Iomega units (Bernoulli box? I probably just butchered that name) on an ST. Anyone?

830. OS9 GUI Web browser?

Newsgroup: comp.sys.atari.st
Date: 1995-04-17 00:00:00 UTC
From: Jongding Wang <jdwyk@tpts1.seed.net.tw>
Message-ID: <3msnej$oae@aladdin.iii.org.tw>
Source record: 167505

Hi there,

Is there any graphical World Wide Web browser around for OS9? I would
like to have one. Any information would be appreciated. Thanks.

JD

True, though I would personally recommend Neodesk over these.

> : - a file search menu command

And from Universal Item Selector 3 and the like, must-have software anyway!

> Which doesn't mean to say you would not benefit from an upgrade to 2.06.
> But IMHO if you want to change your OS, get MagiC...

One thing to remember about 2.06 is that due to changes in the way the
floppy boot happens on powerup (and to some non-portable bootsector copy
protection routines that are quite common), lots of games will not work
with TOS 2.05/6. Some TOS upgrade boards allow you to switch between your
old TOS and 2.06, which would fix this problem.

Personally, I think the money one would expend on 2.06 would be better
put to use by purchasing Neodesk, UIS3, NVDI, etc. The "new" desktop is
vastly inferior to Neodesk, IMHO.

Michtron's stuff does not handle anything larger than 16mb partitions, if
my memory serves correctly. Also, I had it crash on me a couple of times,
forcing me to restore from backup (yet another way to defragg). Diamond Edge
is rock solid in my experience, and I really like Diamond Mirror (included
with DE). Having my FATs and partition information saved once a day gives
me great piece of mind (as well as making undeleting more reliable).

>
> Can you please comment on these three items? Thanx!

NVDI does provide mouse acceleration. So, you would need to get a nice
screensaver (Before Dawn is very cool) and plop Pinhead into your autofolder.
You would be gaining a number of things:

fast GDOS (NVDI is somewhat equivalent to Warp9 and G+PLUS together)
vastly faster GEM graphics (Warp9 does little with GEM, NVDI really cranks).
continued support

NVDI also allows you to replace the system fonts with GDOS fonts, similar to
Warp9's ability (though Warp9 doesn't use GDOS fonts).

I used Warp9 for quite some time, but NVDI really is a superior product IMHO,
particularly if you do lots of stuff in GEM. I do miss some of the
Warp9 screensaver modules, but that is not a big deal when compared to the
performance gains.

There is one included with Ghostscript, called ps2ascii. It is a small
script that invokes gs with some arguments. I'm not sure if it is included
with the Atari Ghostscript distribution.

837. WTB:DA's Layout - English

Newsgroup: comp.sys.atari.st
Date: 1995-04-17 00:00:00 UTC
From: mtaylor@perth.DIALix.oz.au
Message-ID: <3mt30vscc1@perth.DIALix.oz.au>
Source record: 167512

Hello to all,

Well if anyone has the latest version of Digital Arts Layout CD DTP software with English menus etc for sale I am interested. I have been trying to upgrade my Didot Pro B&W for quite sometime to this but DA's Germany give me the complete runaround for the last 12 months or so. I do not need a manual so any German users might be able to help. I beleive the version released in Germany has various languages available from a pop up menu to convert the menus and help messages. This software is very good but the support offered by the UK distributor CGS Computerbild and the author company Digital Arts in Germany could only be fairly described as abysmal. So be warned if dealing with these companies as I have got the runaround from them for the last 12 months or so promising upgrades and it has cost me several thousands of dollars in lost work and costly delays to my customers.

Well if you can help me out please let me know. If there are any other disgruntled users of DA's software out there then how about letting us all know

and we might save everybody else a lot of heartache.

Regards from OZ
Mark

Yes, you don't need full-fledged TCP/IP, just a UUCP (offline Mail/News)
package would suffice.

I'd advise you to ftp to ftp.tu-clausthal.de and get UPoint light
(Freeware) in the version of April 3rd. Dunno if there are English docs
included (or an English .RSC), but I guess the author would appreciate
to get both a Dutch .RSC and docs, if you are willing to translate the
German ones.

The author's address is: brusch@eslapion.shnet.org (Stefan Brusch).

> it. Any idea how the SoundDesigner format looks like?

Yep, got 525 and the most recent version of SOX. I have a demo version of
Zero-X and, if it did Mirage and Akai S612 directly, I might think about
it (but, coming up with $200 right now would be problematic). Don't know
the file format for SoundDesigner and I don't plan to start dumping files
to figure it out (I've done that before - what a pain). It's probably
online someplace, but I haven't had time to look for it yet, and writing
file conversion code is not a very pleasant pasttime for me right now.

Anyway, any other ideas on converting these sound files?

Thanks to all that have responded so far. Have fun! - Bob

>: Anyone able to get MagiC and the ICD software to coexist?

> No problems whatsoever from day one!

Thanks, Steve. I've now found that on my ST, there is no conflict if the ICD boot software's MiNT flag is set to GLOBAL. Otherwise, I get bombs on the ST under MagiC.

On the TT, there seems to be no way to use the ICD software; I get bombs as soon as the bootup stabilizes (as soon as the HD software accesses the disks, apparently). Booting up under AHDI solves the problem, so I am switching the TT over to AHDI.

I have a 80 MB Maxtor SCSI HD for sale. It's the original one which
came with my TT and it's 2 years old.

I'm asking 60 US $ + COD shipping or best offer.

An other deal just didn't work out so I'm reposting this offer.

853. OASIS

Newsgroup: comp.sys.atari.st
Date: 1995-04-17 00:00:00 UTC
From: phil@yeadontt.demon.co.uk
Message-ID: <798143214snz@yeadontt.demon.co.uk>
Source record: 167528

This is an announcement for a new package comming for the Atari range
of computers called OASIS.

OASIS is a GEM based off-line reader replacing the complete set of
AtariNos off-line utilities, the only items retained are the NOS on-line
software and the DEMON.TOS batch file launcher.

OASIS consists of three main parts at present, InterNet, Post Box and
Daily Net.

InterNet allows you to check on any items you have prepared for
uploading ie E-Mail and News Groups.

Post Box lets you read any E-Mail you have recieved, while at the
same time preparing any new E-Mail you wish to send.

Daily Net allows you to read News Groups and submit items of your own.

A fourth element, Spider, will be added at a later date (this year)
which will be a fully functional World Wide Web browser supporting both
graphics and text.

I hope to be uploading this package to Demon's, HENSA's and Sun Sit
s FTP areas along with variuos UK bulletin boards over the Easter weekend.

There will be no shareware policy on version 1.xx of OASIS, just E-Mail
me if you use it. Comments, likes/dislikes, wish lists for further features
and Bug reports, if any :-), would all be appreciated

Watch This Space !!!!!!

854. vt52 on Falcon 4.04

Newsgroup: comp.sys.atari.st
Date: 1995-04-17 00:00:00 UTC
From: awood@f030.demon.co.uk
Message-ID: <798145190snz@f030.demon.co.uk>
Source record: 167529

I know there is a fix for the vt52 codes for TOS 4.01, but is there
a similar fix for TOS 4.04 ?

The reason I ask is that when trying the DB_CON.PRG (which crashed,
as was to be expected from reading the manual!) there are test files
that are supposed to show what the correct results of the vt52 colour
codes are.

Seeing that using the 16 colour test text (in the correct res.)
didn't display any colours except black and white, I assume that
TOS 4.04 still doesn't solve the problems.

Thanks for help in advance!

>haven't noticed one or the other being *better*... Each has performed as
>well as the other... Hutch, I trust your judgement, as you seem to be one
>of the more intelligent people in this group, but I would disagree with
>you on this...

"More intelligent?" Nyah, just a bit older than the average Atarian. My senility is sometimes mistaken for wisdom. ;-)

I will admit that Seagate hard drives do seem to be a bit more rugged than they used to be. Many 'old timers' can surely relate a few horror stories about trashed Seagate drives and the old 'stickion' problem that seemed to be a Seagate patent secret a few years back. :) But, those new Seagate Barracuda units seem to be doing pretty good in that I haven't heard any complaints about them that I can recall. Even so... I still prefer Quantum mechanisms over Seagate but that's just -my- preference.

But I wouldn't have a Samsung drive at -any- price! :)

857. Speed of Light 3.8

Newsgroup: comp.sys.atari.st
Date: 1995-04-17 00:00:00 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <D773lz.L5x@beaver.cs.washington.edu>
Source record: 167532

Speed of Light version 3.8 Image Processor/Viewer was just uploaded to
these ftp sites:

atari.archive.umich.edu
micros.hensa.ac.uk
ftp.cnam.fr

Filename: spoflt38.zip in Graphics directory.

It can also be found on my WWW home page:

http://www.cs.washington.edu/homes/sdenman/

and eventually, the new version will appear on the Atari Web Pages:

http://www.mcc.ac.uk/~dlms/atari.html

under Falcon or ST/STE/Mega STE. Right now, only version 3.7b is there, but
Mark should have 3.8 up soon.

This new version fixes most of the bugs in version 3.7(+ a & b) as well as
some of the more serious bugs in clipping and color palettes. It also fixes
some problems with older keycodes.

Please spread this Shareware version around to various ftp sites and BBS's
and to all your friends!

-Stuart

APPENDIX

For those who don't know, Speed of Light is an Image Processor and Viewer for
ALL Atari computers. It loads GIF, JPEG, IMG, PNT, and Degas Files. SOL
has lots of image processing features like global and local palette
manipulation, histogram transformations, warping, filtering, scaling, rotation,
etc. The list goes on! The program is Shareware, and so some of the features
are disabled until you register.

> Is every Atari owner an idiot when using Mac and PM? Or am I the
> only idiot among (otherwise very Mac-honoring) Atari users..??

Of _course_ not. Don't be facetious. All I'm saying is that PageMaker (along with the equally capable Quark XPress) are the primary page layout tools used by the thousands of commercial graphics service bureaus, desktop publishing houses and independent artists on their Macs in the US (don't know about other countries). They do this work for a living and evidently do NOT experience the difficulties you refer to. So why not?

> If I was the "stupid Atarian who hates Macs", can you please tell me,
> what it was I did "wrong" ?

Ouch! Those are YOUR words, not mine, mate. Thank goodness, too. But in regards to your specific WYSIWYG problem, you did not mention one very key piece of information... what kind of monitor and what resolution were you using PageMaker with? With the wrong resolution, you'll NEVER get WYSIWYG. Just as a guess, try changing to 832x624, if possible with that monitor, and try printing again. You might also check to make sure that you are using the proper PPD file for the printer. This is all SETUP stuff, BTW, that should only have to be configured once (if done right).

Again, PageMaker ain't Calamus SL... but it's still very capable.

>
> 1) mouse acceleration

Yes, NVDI has a built in accellerator.

> 2) screen blanking

There are LOTS of screenblankers available. For the falcon I know two
of them speeding up the computer to 160%....

> 3) PinHead

1. You don't need Pinhead, becuase you can set this directly in the
programs. (It's just a bit in the header...)
2. Pinhead is as stand alone program available.

>a 68040 Mac runs whatever publishing software.

Wow! That's a pretty strong claim there, Tommi. Would you be willing to submit to some kind of comparison testing? I don't own Calamus SL any longer and honestly I just don't remember it being quite THAT fast.

Hey, If the Falcon's 16MHz 030 can outrace a 486-100DX4 PC or a 40MHz 68040 Mac in identical dtp tasks, then that really IS saying something.

And if Calamus SL on a Falcon030 is that good, the world should know!

HM>Atari-world

Why not? Most of the Atari ST users use SCSI devices, so installing
a ZIP drive shouldn't cause any difficulties. It can also be used as
a backup device because of the cheap ZIP disks.

HM>Special features, e. g. enabling/disabling of cache, auto-
HM>park/shutdown, software selection of the ID and this sorta stuff are
HM>more or less vendor specific and might not be supported by _any_
HM>software.

I think the first ST programmer using a ZIP drive will write a CPX
module for the non-standard features. :-)

GEMBench FPU test runs on 040s. On a full spec 040 you need a certain patch
called FPU_M883.PRG.

Hallvard Tangeraas <hallvart@oslonett.no> wrote:
>what software can I use to convert .IMG to .GIF files?

The wellknown ShareWare programs GEMView and Speed of Light can do
this for you, but there is also a FreeWare alternative: MGIF 4.4

Since MGIF always stores images in 8 (or 3 * 8) bit format internally,
you will unfortunately not be able to handle IMGs much larger than
800x600 or so on a 1Mb machine (I run MGIF with 10Mb virtual memory,
so I never have any problems ;-), regardless of the number of bitplanes
in the IMG (yes, MGIF 4.4 handles colour XIMGs).

Saving an image as GIF with MGIF 4.4 is slower than with Speed of Light
and the file will probably be a bit larger. On the other hand, MGIF 4.4
will reload the GIF faster than anything else if you want to do that.

MGIF 4.4 was originally supposed to appear about a year ago, but it
will finally be released RSN(TM). In the mean time, the latest beta
versions are normally available at my ftp site, rand.thn.htu.se, but
that is not working at the moment due to an OS downgrade.
Until I get the ftp-daemon recompiled for SunOS 4.1.4, please ask and
I'll email a copy.

Falcon has not passed. period. It is slowly becoming a music production unit next to Mac/Session -workstations. Even the conservative Keyboard Magazine (in the new Music & Computers -add-on issue) puts Falcon next to Mac /PC -systems, if you don't need to do all the non-musical stuff with it. C-Lab, Wizztronics, Soundpool, Steinberg and other companies are combining their efforts - to make a dedicaded music/video production workstation. Just check the AEO 0404, and you'll see what I'm talking about.

People, please try to understand this:

Falcon is a *music-computer*, treat it that way. So if you need to compare it to all the others, compare the sound-system, software quality and stability, and audio expandability - not processor speed, CD-ROM availability, or graphics.

>hook it up to my Falcon. I know I need a SCSI 2 cable (or would just plain
>SCSI do) to connect but how do I get the Falcon to recognise it ?

If the thing is formatted (and has a bootable partition on it [if it is
the only HD you have - in which case set the SCSI id to 0]) simply plug
it in using the SCSI2 cable and power it up.

The Falcon should autodetect the drive and if it is device 0 and bootable
will then boot off it.

I think that is all there is to it

Steve.

I thought (don't know for sure) it was possible to change the startup
resolution in the NV-RAM. If this would be possible (I don't own a TT
so I can't test it) the resolution would be changed to ST Hi (or what
ever) before GEM or MiNT is run.

>think this was a stupid idea? I would have done likewise.
>

Perhaps you would, if you're going to base you company on old machines. But while 2B and Heidleberg are dumping program for the old machines, people on the Falcon, (and newer Tos compatible machines) are going away from the market, which means while Hedleberg has supported a bunch of old machines, they never manage to support newer, and their company will eat itselves from behind, (if you know what i mean).

It would have been the same if they wrote a program specially for the 286, and not supported 386 and 486. And just try tell me how many companies would do a thing like that today, and survive the market as well ? Heck, now they mostly DON'T support lower than 386DX<something>
(just an example)

Normal way to do things, is to write a new program which is backward compatible, (if thats what you want/need). But i guess backward is a word Heidleberg isn't aware of.

Greets
Kim

I cant help with the problem, but I too have a few probs with my
internal IDE drive. For example every now and again it
creates a new partition which is about 600k in size!!!
This is called G, after a short while this partition usually
disappears but I dontlike it.

Can anyone suggest why this is happenening? Oh abd by the
way partition F is NOT full!!!

General! We have intercepted a coded Imperial message from the Hague system!

AH> From: andrew@minster.york.ac.uk (Andrew Hague)
AH> Has anyone, or is anyone producing a DSP modem for the Atari Falcon?
AH> I've got the C source code for such beast and I'm about to port it
AH> to the Falcon.
AH> Before I do, I thought I'd find out if someone else has done it.

Not seen one yet - but we have the code from Motorola to do the job. It's on the Motorola Dr-BUB BBS.

AH> BTW. I'm not sure if the DSP will be fast enough to generate the
AH> modem sounds but I'll try. The modem can only go up to 1200 baud so
AH> don't get too excited. I think it will manage to send and receive
AH> faxes too.

The DSP56K is capable of simulating a 32kbps modem (maximum I think), so you shouldn't have any hassles if you do this in ASM as DSP's are a waste of space with 'C' - but I imagine you know this already.

Doug.

I think I have just what you are looking for - it's called EDPOV and I got it just a few weeks ago from a French magazine.

It is a bit strange (and seems to just quit out sometimes for no good reason without any bombs or anything) but it does cover the whole of the POV language quite well. The positioning of objects is not so good (the object leaps a few pixels when you click onto it) but generally it's quite easy to use and covers a good range of file formats. These include 3D2, InShape and others, but you can only turn these INTO POV scenes - you can't turn POV's back into 3D2 for instance. Each file is treated as an object so you can import or 'merge' 3D2 files into an InShape scene quite easily.

I will upload it onto NeST as I think I've seen you around there from time to time...

Cheers,

Doug.

: >Now the Falcon has arrived (in the same clothes) and passed (for the same
: >reason) and we're STILL crying about it.
:
: Falcon has not passed. period. It is slowly becoming a music production
: unit next to Mac/Session -workstations. Even the conservative Keyboard
: Magazine (in the new Music & Computers -add-on issue) puts Falcon next to
: Mac /PC -systems, if you don't need to do all the non-musical stuff with
: it. C-Lab, Wizztronics, Soundpool, Steinberg and other companies are
: combining their efforts - to make a dedicaded music/video production
: workstation. Just check the AEO 0404, and you'll see what I'm talking
: about.
:
Atari have stopped making it, and marketing it. If this is not "passed" in
the sense I wrote, what is? The only Falcon available as a supported machine
now is the C-Labe version, at nearly ukp3,500 (or was it more?) This is NOT
home computer territory, which is what the ST was.
:
: People, please try to understand this:
:
: Falcon is a *music-computer*, treat it that way. So if you need to
: compare it to all the others, compare the sound-system, software
: quality and stability, and audio expandability - not processor speed,
: CD-ROM availability, or graphics.
:
: >I'm going to keep my ST if the finances will let me. It's still a damned
: >good computer, still easier than the Mac. It's just not quite good enough
: >today.
:
: For what?
:
Hi-res colour graphics, interactive video, complete internet access, speed,
all come to mind immediately. I daresay I could think of several others.
It's a ten year old design, for heaven's sake. Of course modern machines are
better. Would you like to be using an original Macintosh, or PC-XT today? I
doubt it.

I just wanted to *try* to explain why I moved from being a dyed in the wool
Atarian to a user of a.n. other machine. If Atari made a machine as capable,
as well supported and up to date as the current Macs, I'd have bought one.

They don't, they aren't likely to, so I didn't.

Windows yes, but who talked about using Windows.. Have you ever heard about
OS/2. And if everything should go wrong, there's always DOS, which i belive
is very bad, but still an alternative.
What alternatives do we have on our Atari ?

>agree that this was a stupid move. There we go agreeing again! 8^)

Arrghh.. Don't let it happen again Tom.. IT's starting to get to my head 8)

As far as i understand the Falcon version should be ready. Perhaps there is
some minour changes which can be done, (there always is). But as i said
in my previous message, all software is suppose to be backward compatible,
which means you start at the highest point, (ie. the Falcon), and working
your way down backward, if it's needed, (which i agree it may be when talking
about an new OS).

I can not find any reliable excuse for not doing it like this, unless
Heidleberg/2B simply don't want the Falcon to be supported, which is what
i'm reading between the lines.

I'll get my PC one of these days. From this i'll just let things happen the
way they arrive.. I'm getting sick and tired of all this shit with Atari
software, trying to convince people about the need of software support.
The Falcon may well be an outdated machine, but thats not because of the
hardware. Thats because of lack software support!

There may well be alot of pleased ST/TT users out there using Magic now, but
you just try ask them what they want to do when there is no more new software
for their computers. Do you think they're gona upgrade to a Falcon ? No, why
should they, there isn't any software for the Falcon either, because stupid
software producers/distributers "FORGOT" to support it. This means people
are jumping directly from the ST/TT to another platform, insted of upgrading
within the same platform when it's available.

They're simply killing the market insted!

And just remember, i not only own a Falcon, but also 4 ST(E)'s, so i should
perhaps be pleased with what i can get. Thats just not the way i see things.
I didn't spend 14.000 danish Kr. on my Falcon just to see my old machines
getting all the support. And if Heidleberg and c/o can't understand this,
they would be better of leaving the market insted of destroying it.

Tough words from a low-end user, but i'm sure alot of Falcon owners agree
with me. Heck i even think alot of ST/TT owners would agree. I would have
said exactly the same even if i didn't had a Falcon.

Is there a way to patch around this Micky? A lot of people have
2.05/2.06 (me included of course) and it is a real pain to find those
dear old games don't work anymore not to speak of setting up a
switchable TOS!

Someone else has also sugested that it might be the extra memory on
most STE machines causing problems with old games. I think there is
patch for this (make1meg?), anyone know where it is?

IIRC, PinHead has nothing to do with Screen saving. It was a program that allowed the setting of the Fastload bit on operative systems *prior* to TOS 1.04. It isn't necessary for machines running 1.04 and upwards!

The Atari CHKDSK program will attempt to re-build FATs as will ST_TOOL19.
If you have the ICD Clean-up this will also usually make an intelligent job
of fixing the FAT

Yes its still cheaper for me to buy ST-Fax from the USA than to buy
CoMa, ST-Fax works out at $120NZ and CoMa from say the UK at $140NZ..

And CoMa is being pushed as Shareware, not like ST-Fax....

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having

to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys, xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh, xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available at your site. If you don't, ask your local system operator how to transfer files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for "low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

It doesn't matter how many "exist". It's how many are "in use" by people
still spending money on their Ataris. That's what counts.

Unique Developments Sweden have only done STE/Falcon-only games and they intend to keep on doing STE/Falcon-games. So there is not a big chance for the DOOM-clone (ie. SubStaition) to run on a STfm.

I have about the same impression that you have.
MagicMac running Calamus SL on a Mac LC-630 (with 68LC040 CPU) is EXSTREMELY fast and therefore it's a good buy for Calamus DTP-users.

But the Falcon is the best all-round Atari-machine, definitly.

SuperSam 1.08 will do this, not only playing WAV files, but AVR, AIFF, AIFC, DVS, VOC, IFF and raw samples too! Can be installed to run and play by dropping a sample on it's icon or by double clicking on a sample. It will play any sample of anylength, if there isn't enough RAM to load it it will play direct from disk.

In addition you can use it to edit the sample to your hearts content.

atari.archive.umich.edu and it mirrors, ftp.cnam.fr and ftp.uni-kl.de all have the file (SSAM108B.ZIP) as do most other atari sites by now.

1.08 has a few bugs, but a new version will be released in a few weeks that fixes them all and adds new features too.

SuperSam is shareware.

: Here's the problems; first, I currently only have 4megs ram in the powerbook,
: but will be upgrading soon. However, even with all extensions off, by the time
: MacMagic gets loaded I have only 1meg free ST ram! MemWatcher reports that I
: have 3384k total ST ram (or about that), but MacMagic takes a full two megs!
: Add Neodesk, and even in 16 colors instead of 256 I have only a meg left.
: Like I said, I'm going to upgrade, but does the final version of MacMagic
: really take two megs? Does the ST version of Magic take so much ram? I use
: Geneva on my ST, and that's extremely small. Anyway, I would like to be able to
: have a 10meg powerbook and not have to restart with extensions off everytime I
: want to run my ST software in order to make up for two megs of ram which seem
: to be dedicated to MacMagic.

Just deactivate Ease and run Magxdesk instead.
Ease itself (only the shell without system) needs ~1MB RAM when running
with 265 colours.
Magxdesk needs 150 kB of RAM but doesn't have coloured icons in the current
version.
MagicMac with Magxdesk runs fine on a Mac with 4 MB RAM. We tried it and
had about 1.5 MB free RAM.

>for the total package (CoMa PRO) runs to about ?150.

Er, I don't think so. When I registered CoMa+voice, I payed 180 DEM. This is
Fax send and receive, voice responder through Zyxel or another modem (Zoltrix?)
and a basic FTP. 180 DEM near as I can tell should be around 60 pounds.

Coma professional, with a complex telephone responder system is more expensive,
but that is a business strenght programm, and I don't need that.
Nor do most other people.

Brilliant deduction there, David. Of course that's what I meant.

But you still haven't answered my question. Why do you think it was a
stupid idea to develop Magic for non-Falcon machines first? You don't
have to LIKE that decision, of course, but I think it was wisest.

Or do you really believe that there are more Atari Falcon 030 machines
out there "in use" than all other ST/STe/TT machines?

If so, methinks you have been seriously misled by someone's propaganda.

Er... IMHO, of course. ;-)

> -> i am looking for a hard drive for my 1040ste. something small (in the 200
> -> MB range or less) would do. what do i need to accomplish this

> TOAD COMPUTERS / 540 meg **** BEST BUY *** / only $259 US dollars!

If that is a complete external setup with host adapter, case, power supply,
cable, etc, then that IS a good deal, it seems.

If it is only the mechanism itself, then you can do much better (such as
a new Quantum 730Mb 3.5" LPS SCSI for $259 from various dealers).

You will NOT find a better dealer than TOAD, however.

Hmmm... so you have a pirated copy of TOS 1.0 on disk, eh?

Calm down, calm down. I'm not gonna preach. I doubt if even Atari cares much how that old buggy TOS executable gets passed around. Unless they get the idea there is $$ to be made (or lost), that is. ;-)

Anyway, why does it seem curious that it takes up a lot of room? As I recall TOS 1.0 used about 200K of the 512K that was installed on the original 520ST boxes, correct? And it loads right into RAM, of course.

: To me its far to dear for a Shareware products...

Strange comment! What makes you tnink It's shareware when you quite
blatently refer to it as keyware???

Also what is wrong with this "shareware" being expensive? Do you
think that Papyrus is shareware because it has a demo available?
Or is it more a fact of "It's called shareware so it must be crap"?

Just because someone has allowed you to see and test their product
before you part with your readies do you tnink that makes the product
inferior? Some very good packages (Such as Kandinsky) are shareware
and match in quality "comercial" products with much higher price
tags.

Perhaps people should drop this "keyware" lark and treat such
programs as "demonstration" progs. This could help change a few
attitudes and revive the dying Atari "Private-comercial-ware"
(Because thats what shareware is!) market. Just a thought.

Another point, on the Mosiac page of TowersII screen shots, it
appears that there is a multi player mode. E.g the picture
has 4 screens.

Does this mean you can have several players on screen at once?

I have looked through the manual, but perhaps I've missed something.

Rod

> prefer Quantum mechanisms over Seagate but that's just -my- preference.

Memories of clonking many many Quantum 105S drives (in Sun Sparc1+'s) to
break stiction and get them to spin up, coupled with the killer 9gb Seagate
drives for only a little over $3000..... I've never had problems with
Seagate SCSI stuff, and would recommend it any day of the week.

Incidentally, the probable reason why there are more old-timer stories about
Seagate drives is simply that Seagate has been around forever (I remember
their old MFM/RLL stuff, gaaaaa!). :-)

>the screen or directorly to the hardware (MIDI and Most Games.) I have

There is a hardware add-on available, developed by Harun Scheutzow of
HSMODEM-fame, that gives you a true parallel-, serial- and MIDI-port in any
MAC with a PDS-slot.

For more information contact OverScan

Internet : pj@contrib.de
WWW: http://www.contrib.de/~pj

>works. I could not get Neodesk 3.0 to run and Gemini will not let you
>read directorys

Which version of Gemini? The latest 1.A ought to work. Perhaps Julian could
comment on that as well.

>Look for a what work and what don't listing Soon

There still is the compatibility-list from ASH.

Bye.

There is a serial mouse driver available at ftp.uni-paderborn.de in
/atari/tools/util/mouse22.lzh. It will allow a Microsoft compatible
PC mouse to be used from Modem1,Modem2,Serial1,or Serial2. The docs
are all in German and you will probably want an ST with more than
one serial port to use it.

From: smoore@chowgar.demon.co.uk
Message-ID: <798168276snz@chowgar.demon.co.uk>
Source record: 167486

Ah well, I knew it would happen one day, I have somehow managed to mess up the FAT on partition F on my Falcon IDE drive. Obviously I'd like to retrieve as much data as possible but at the very least there is one Calamuse CDK file that I could do with. I have found out that this file starts at sector 410 and goes on for quite some time (I don't think the partition was fragmented before this happened). Is there any way I can rebuild this file? I've tried Knife ST and it won't even let me look at an individual sector it just tells me there is something wrong with the FAT. The only software I have than shows me the sectors is called Disk Doctor and I don't know if I can build the file from within here.

Can anybody offer any advice?

Regards.

939. OASIS availvble

Newsgroup: comp.sys.atari.st
Date: 1995-04-18 00:00:00 UTC
From: phil@yeadontt.demon.co.uk
Message-ID: <798165928snz@yeadontt.demon.co.uk>
Source record: 167488

This is an announcement for a new package for the Atari range of
computers called OASIS.

As of Tuesday 18/4/95 I have upload OASIS100.ZIP to the following sites

DEMON ftp.demon.co.uk

Posted to the incoming folder in the Atari section of
their FTP site

HENSA micros.hensa.ac.uk

Posted in the incoming/atari-tos folder in the incoming
area of their FTP site

Chameloen BBS (UK 01454-831095)

Uploaded to the Comms area of the bulletin board

OASIS is a GEM based off-line reader replacing the complete set of
AtariNos off-line utilities, the only items retained are the NOS on-line
software and the DEMON.TOS batch file launcher.

There will is no shareware policy on version 1.xx of OASIS, just E-Mail
me if you use it. Comments, likes/dislikes, wish lists for further features
and Bug reports, if any :-), would all be appreciated

940. Falcon, what can it do?

Newsgroup: comp.sys.atari.st
Date: 1995-04-18 00:00:00 UTC
From: shawstad@mhd1.moorhead.msus.edu
Message-ID: <3mvd18$c19@urvile.MSUS.EDU>
Source record: 167489

(I'm hoping this will auto-post thru my server despite being a moderated group.)

I'm posting because I didn't see a FAQ. If there is one, could someone send it to me? Advance thanks. :)

I was a die-hard 8-bit user but sorta lost touch over the last few years. However, one look at the specs of the Falcon030 blows my mind. Im wondering if there are any programs out there that use the DSP for multi-track digital recording or processing? (I remember hearing a demo of the Yamaha DSP-1 sound processor several years ago, was wondering if I can process audio with the Falcon like that...) I also have a need on the side for a scientific reason, recording and processing the full frequency range of cetacean speech. Does anyone know if it can work with 300khz? Anyone out there want to volunteer programming help or services? ;)

Im also trying to find info on any user-groups (or even any users at this point!) so I could get more information on the Falcon and the software available for it, as there is zero information available locally. Can anyone lend a hand?

Advance thanks,

Mike Shawstad

As Dan stated, you have to set up various MAGX.INF files with the proper _SHL line. Ditto for Geneva in the .CNF file. The MagiC manual, though very sketchy on most topics, is clear on this one. You can forget about getting MagiC and Geneva working together (who would want to). Also, Warp9 will easily screw up anything you do with MagiC (but its great with Geneva.)

In article <3mj11hojt4@mhade.production.compuserve.com> BobR <76702.1466@CompuServe.COM> writes:

Re: What's needed for an Atari hard drive...

You'll need a "host adapter" like the ICD Link (available direct from ICD or from stores like Toad Computers in Maryland) which comes with the necessary drivers, utilities and cables to connect to the DMA outlet on the STe.

Is the "host adapter" some kind of hardware, or is it just some cable?

Then you'll need a standard SCSI hard drive mechanism which just plugs into the ICD Link.

Finally you need a case to put it all into, and a power supply.

Be aware too that early units of the 1040 STe had problems with their DMA chips which can possibly trash a hard drive's file system at random intervals.

I don't remember the exact details, but you can check the part number on the chip to determine whether it's one of the suspect chips or not.

Which are the suspected part numbers?

Thanks,
/Adam

In article <798145190snz@f030.demon.co.uk>, awood@f030.demon.co.uk (Andrew Wood) writes:
> I know there is a fix for the vt52 codes for TOS 4.01, but is there
> a similar fix for TOS 4.04 ?
AFAIK TOS 4.04 has the same problems 4.01 had. I don't know which fix
you mean, but if you have it, I would just give it a try! Btw, using
NVDI will also fix all the VT52-problems.

Ciao

>hook it up to my Falcon. I know I need a SCSI 2 cable (or would just plain
>SCSI do) to connect but how do I get the Falcon to recognise it ?

The Falcon-side needs the SCSI2-style thinggy. I would guess that the
external drive has this standard 50-pin-female centronics connector.

This cable might turn out to be quite expensive, as SCSI-2 defined a higher
quality demand for its connectors and cables.

>I've got ICD Pro utilities so I suppose something on there would do the trick
>but I'm hoping I won't have to mess about with the ADHI software I'm using for

Plug in the necessary cables, terminate the external drive, format/partition
it, install the ICDBOOT, and go :-)

It should be that easy. Parity needn't to be worried about on a Falcon.

AFAIK, the ICDBOOT doesn't give you the chance of selecting the order of the
connected devices. Meaning that you still have to boot from the rather slow
IDE, than the faster SCSI.

But not having used the ICD stuff on a system with IDE, I am not absolutely
certain on this.

Don't forget to disable the unused SCSI-devices from within the HDUTIL. That
saves you a lot of time on bootup.

Bye.

> ^^^What does the OS do with the DSP???

From what Wilfred told me on CeBIT, the OS-functions and calls related to the
DSP-functions are not completely implemented into MagiC3.

So I would say it is not quite "what does the OS with the DSP" but rather
"what calls does the OS provide for the application or developer".

Sounds simple, doesn't it? But IMO quite a heck of a task ...

>But I wouldn't have a Samsung drive at -any- price! :)

Well, do you have any substantial evidence that Samsung drives are bad ??
I think it's quite easy to knock of a well known brand just because they
just started producing harddrives. There is a great chance that the memory
chips inside your computer are Samsung too !

The VCR they produce are known for their quality and fair price, some of
these old VCRs were never cleaned and kept on running and running.

And have you ever heard of Samsung ships sinking ? (they have one of the
biggest tanker manufacturing yards in the world!!!)

I would use a Samsung HD without hesitation! But then again, at my office
we're running a fileserver on a Seagate drive too ! (over 3 years now, 24
hours a day), no problemo.

>And if Calamus SL on a Falcon030 is that good, the world should know!

I guess that wouldn't be too hard for the Falcon to win. I bet most of the routines Calamus SL uses are written in assembler to optimize to the max. Most stuff for PC's is compiled C, furthermore most VGA cards are still a bottleneck in the performance, although the new accellarator cards are getting very smart too. But since there is no definite standard for the PC platform there is no way to optimize code to get maximum performance out of it's CPU and/or screen.

Hi Jack,

I had a similar problem when I started X as a user other than root:

xterm error 14, errno 13: permission denied

and eventually traced it to the /dev/ttyp* devices which only had write
permission for root. Are you sure you have these devices? I'm not sure
where mine came from - they may have been in one of the X archives from
tsx-11 or I might have made them with the MAKEDEV script in /dev.

Hope this helps...

954. WTB:DA's Layout - English

Newsgroup: comp.sys.atari.st
Date: 1995-04-19 00:00:00 UTC
From: mtaylor@perth.DIALix.oz.au
Message-ID: <3n2m7ospd1@perth.DIALix.oz.au>
Source record: 167377

Hello to all,

Well if anyone has the latest version of Digital Arts Layout CD DTP software with English menus etc for sale I am interested. I have been trying to upgrade my Didot Pro B&W for quite sometime to this but DA's Germany give me the complete runaround for the last 12 months or so. I do not need a manual so any German users might be able to help. I beleive the version released in Germany has various languages available from a pop up menu to convert the menus and help messages. This software is very good but the support offered by the UK distributor CGS Computerbild and the author company Digital Arts in Germany could only be fairly described as abysmal. So be warned if dealing with these companies as I have got the runaround from them for the last 12 months or

so promising upgrades and it has cost me several thousands of dollars in lost work and costly delays to my customers.

Well if you can help me out please let me know. If there are any other disgruntled users of DA's software out there then how about letting us all know

and we might save everybody else a lot of heartache.

Regards from OZ
Mark

No multi-player option, these are four screen shots put into one picture
to make it easier to view. Sorry to disappoint you.

Like you said it is a great game. Gets much better after you pass the demo
part so get the full version!

modern/fast/efficient compression/modulation methods are patented, but can
be used freely with certain makes of DSP's. (TMS320??)

962. "doom" clone - here is some more info

Newsgroup: comp.sys.atari.st
Date: 1995-04-19 00:00:00 UTC
From: mdekker@fwi.uva.nl
Message-ID: <3n2gd8$1q1@banaan.fwi.uva.nl>
Source record: 167385

In this months ST Format, there is an interview with the makers of
SubStation (a "doom" clone for atari computers). I didn't read the
entire story but here are some facts:

- it runs on STE. MegaSTE and Falcon. Needs 1Mb, comes on 3 disks.
they didn't mention the TT....
- it gets 25 frames per second. They didn't mention whether this is on
the falcon or on the STE. They did say the falcon version will run
more smoothly.
- NO texture mapping on the walls. They use gauraud (sp?) shading instead.
(and it looks ugly, IMO).
- you can link up to 4 computers via MIDI cables to play multiplayer
games (deathmatch or co-op).
- they didn't how much it will cost, but they did say it would probably
be about the same as Obsession. No release date, but should be soon.
- very good sound, it appears.
- it runs in 320x160.

IMO, this is not a doom clone but a wolfenstein clone. The pictures that
were shown looked not too good.

The makers of the game did mention the following (very) good point (IMO):
they had played a lot of doom of course and they said that the music/sound
was one of the most important elements of the game, and thus decided to make
up for the bad grahics (in comparison to doom) with great sound. They
seem to have succeeded there.

So, this game shouldn't be compared to doom with all (IMO) but with wolfenstein.
Owners of PC's will be diappointed with SubStation, but considering that
modern PC's are 10-20 times faster than a STE/Falcon (according to the
makers of SubStation) I guess this is as good as you can get.

Cross-posted to: rec.games.video.atari,comp.sys.atari.st,alt.atari-jaguar.discussion

I have sold most of my ST equipment but I still have an Atari SC1224 monitor for sale. In excellent condition. Still in the original box with all the original packing and documentation. This monitor has the controls in the front bottom of the monitor. Excellent for use with most ST compatibile computers and makes a terrific monitor for the Atari Jaguar with the right cable. If interested, please make an offer by e-mail to:

gaglenn@ix.netcom.com

^^^^^^^^

As has been mentioned by one or two others here, this is not true.
If you don't believe me, please take a look at the chip. If what you're
saying was true, then there'd be 3 * (24 + 16) = 120 pins just for the
memory busses. You'll have trouble finding all those pins. ;-)

By the way, the cycle mentioned is an instruction cycle which is two
clock cycles long.
(Reference: DSP56000/56001 User's Manual, chapter 2.2)

>one to X memory, one to Y memory, and one to Program memory. The Falcon
>has three memory areas to support these (although they do overlap a bit).

The Falcon DSP has one, single ported, 32k * 24bit SRAM.
The memory is mapped so that the entire area can be used as program
memory, with the X memory overlapping the top 16kword and Y the bottom.

> The confusion may have arisen because each memory block (X, Y, or
>P) can obviously only have one access per cycle.

The confusion is more likely caused by the three internal address busses.
The 56k can make two internal and one external memory accesses during one
instruction cycle.
Internal P memory is 512 word RAM while the internal X and Y memories are
256 word RAM/ROM each.

> Go ahead and spend your $800 (that's a bit much for a USED Falcon
>isn't it?)

With this I can agree.

Who the all-knowing JT? I regulary move between my ST and a
DOS6.2/Windows 3.1 environment. Life is grindingly slow and complex on Win,
I really look forward to getting back to the ST.

RS> I can't even believe any one with some kind of computer knowledge can
RS> defend the Atari in any way to-day...

I don't want to start a "my willy is bigger than yours" banter but most of
the technical arguments would count against the PC architecture and
technology, the marketing argument would be in favour of the PC.

RS> If PC machines are that bad why do they sell so well, and why have
RS> most other
RS> platforms have droped by the way side, Facts can't lie....

.....but their interpretation can.

Most PC users have no say in the purchase of their equipment. The majority
would not even know how to go about making a comparitive evaluation. The
buyers are companies who (ATM) are concerned to protect their earlier
investments and establish a common workplace platform. Other new-starters
will, in general, join the largest group seeing a guarantee of continuing
support. Small groups of specialists (DTP, music, CAD, graphic designers)
will buy the platforms most supportive of their specialism.

Hamburgers and Coca-Cola "sell well" but I have not heard this being quoted
as proof of their nutritional worth.

The Atari CHKDSK program will attempt to re-build FATs as will ST_TOOL19.
If you have the ICD Clean-up this will also usually make an intelligent job
of fixing the FAT

I started this thread and so far I still haven't been able to get MiNT to
boot to ST Hi on my TT. I've tried NVRAM, it didn't do anything but the
version I had was in German so maybe I didn't use it right. Please keep
posting suggestions. I know someone out there has this up and running on
a TT in ST-Hi I just hope they read this and reply.

I thought I saw something in a previous thread awhile back about changing
some setting in a initialization file in MiNT but I wasn't trying it then
so I didn't pay much attention. All help is greatly appreciated.

Thanks

From: bjr2@Ra.MsState.Edu
Message-ID: <3n379v$ig8@NNTP.MsState.Edu>
Source record: 167400

Hello,
I recently purchased a used copy of Page Stream 2.1 and later discovered I was missing one of the CS font disks (disk 2). So...I only have a portion of the CS fonts that came with Page Stream. Could some kind semerian please email CS disk 2 to me? The files in question are any CS fonts that came with Page STream. Two of the fonts (Times and Trimulvative) show up in my font manager, yet they are both useless because there is apparently no spacing or kerning data with them. Garamound is missing altogether.
Please keep in mind...I'm not asking anyone to pirate a copy of Page STream...I do own the origional disks and all origional documentation. Only asking for the complete CS Fonts that shipped with version 2.1.
Also...I would appreciate any information about upgrading to Version 2.2. How much is it? What does it add or fix?
Finaly, is there an ftp site that supports Page Stream? Someplace where one could find things like import modules, printer drivers, and so forth as they come out?

Thanks,
Brian

978. Atari Mini Swap Meet at Ontario Computer Fair Sun Apr 23/95

>Well, do you have any substantial evidence that Samsung drives are bad ??

At my place of work we've had 3 Samsung drive mechs die a horrible death
in recent memory. There may be more but that's all I recall.

>There is a great chance that the memory chips inside your computer are
>Samsung too !

Possible, but what does that have to do with hard drive quality? Given
all other factors being the same, I'd rather buy a hard drive from a
company that manufactures and sells ONLY hard drives, not washing
machines, toaster ovens, etc. It leads me to think they might know more
about the HD business. Perhaps a false assumption but that's just me.

>The VCR they produce are known for their quality and fair price

Maybe that's the case in YOUR country, but in the US, Samsung VCR's and
hi-fi gear have a reputation (unfounded or not) for a level of quality
that tends to match their relatively low price.

>And have you ever heard of Samsung ships sinking ? (they have one of the
>biggest tanker manufacturing yards in the world!!!)

Based on what I know of their hard drives, they should stick to tankers.

:)

But seriously, one can run into trouble with ANY make of hard drive
(or chips or VCR or tanker or ...) and it doesn't take too many bad
experiences to make one think they might have a quality problem even
though their _overall_ quality may be quite good. When it gets right
down to it, I imagine there is a very thin line that separates the
quality differences of most hard drive manufacturers.

So I digress... I should have said that my -personal- experience with
Samsung gear has been less than stellar but YOUR mileage may differ.
And I've already admitted that Seagates are probably OK too, since my
bad experiences with them was primarily with the old MFM/RLL units.

Fair enough?

>>think this was a stupid idea? I would have done likewise.
>
>Perhaps you would, if you're going to base you company on old machines.

No, I would be basing my company on the goal of trying to make a profit.
Once some cash flow was enabled, -then- I would try to expand my software
to make it compatible with machines that have a lower installed user base,
such as the Falcon.

If the software could be made to be Falcon compatible from the start, then
obviously that would be the ideal way to go; but that's not always feasible.

>It would have been the same if they wrote a program specially for the 286,
>and not supported 386 and 486.

Well, methinks your analogy is a bit weak here. There are enough machines
in use in any ONE of these categories (286, 386, 486) for a company to
theoretically survive by supporting that machine alone (not that they
would want to, of course, but it's possible). There simply are not enough
Falcon030s in use to support a single-product company for very long.

This is all academic, anyway. Companies will frequently do something that
the user doesn't like or does not understand but there is often a very
good reason for it and usually it's profit based. That's business, ya know?

-Hutch- @ Fair Dinkum Tech

But
while 2B and Heidleberg are dumping program for the old machines, people
on the Falcon, (and newer Tos compatible machines) are going away from the
market, which means while Hedleberg has supported a bunch of old machines,
they never manage to support newer, and their company will eat itselves from
behind, (if you know what i mean).

************************************************
```
Jam 4--------Atari Falcon-------Audio expander box

Jam 4 expands the D2D system of the Atari Falcon by adding two extra
(totally 4) output channels.

Jam 4 has a low noise preamp built in with microphone (phantom power)
and line inputs with gain so that the A/D of the Falcon is Fed
with optimum audio level and thereby reducing noice.

Jam 4 is equipped with 1/4 in jack sockets on all in and outputs.

Jam 4 gives greater flexibillity and permitts 4 separate channels or
fx stereo + 2 effectsends in programs such as Cubase Audio.

Jam 4 automatically follows the sampling frequecies of the Falcon.

Jam 4 works with or without the FDI and SPDIF interfaces.

Jam 4 can even straighten out the bass boost of older Falcons!

-This is just what many Cubase audio users have been lacking,
at an affordable price.

-If there is one single accessory you should buy to Cubase audio
then it must be Jam 4!!!

The price is only 1836 + VAT in SKR (Swedish Crowns) + Postage
(approx250 USD. approx 156GBP or 350DEM + 25%VAT + postage)

Jam2, a stripped version of Jam4 is available at 1596 SKR. Its the
same as Jam 4 but without the preamp and only the two extra ouputs.
(approx 215USD. approx 136GBP or 305DEM + 25%VAT + postage)

If you are interested in buying a Jam 4/2 or if you want more info,
please fax or write to:
Line Audio Design

990. Anyway to use an SLM804 on a Falcon?

Newsgroup: comp.sys.atari.st
Date: 1995-04-19 00:00:00 UTC
From: sxp17@po.CWRU.Edu
Message-ID: <3n3et8$cva@usenet.INS.CWRU.Edu>
Source record: 167413

I know that the HeatSeeker Interface that was purported to allow SLM804 use on the Falcon just never made it to the market. I don't see the major problems with using SCSI (w/ DMA built in) to connect to the SLM804. Anybody have any clues?

It seems a waste to have to spend $500 on a new LaserJet, and lose sooooo much speed in the process. (It could be argued that the power consumption of the SLM804 would cost me more in electricity bills, eventually, but . . .)

Thanx for any info!

991. Booting TT in ST High

Newsgroup: comp.sys.atari.st
Date: 1995-04-19 00:00:00 UTC
From: troyc@bnr.ca
Message-ID: <3n3g9g$i61@batph8.bnr.ca>
Source record: 167414

Ok, I finally found a way to boot the TT in ST High rez. This allows you to use something like Superboot in ST-High to select your auto programs and ACCs (Superboot has the advantage of letting you specify "other" files for configuration, other than just desktops/auto progs/accs, like MiNT CNF and device drivers!).

The base code is already written in a program called TT2STHI.ARC which you can get on Atari Archive. The program states that it checks for TT high and the TT cookie before switching to ST high, in order to prevent problems with people using TT high mode.

So I ran this program from TT medium and nothing happened.

A closer look at the source (included in the .ARC file) reveals that the program will only switch to ST HIGH if your TT is already in ST LOW. The conditional statement basically states that if you don't have the TT cookie, AND your resolution is greater than ST low, then don't switch.

I modified the code to check specifically for TT high AND the TT cookie before a switch. I also had to change one of the include files to use the MiNTLIBS instead of whatever the author was using.

Now I have this first in my autofolder and my autoprogs boot in ST high. The good thing is that if I run MiNT, then the screen stays in ST high and everything is setup for MiNTX.

Linux should work on Falcons, too. You'll definetely need the FPU, though. But
that's not too much of a hastle to install.

AFAIK, there are still some problems re. IDE vs. SCSI to be sorted out,
though.

1000. MinixFS question

Newsgroup: comp.sys.atari.st
Date: 1995-04-19 00:00:00 UTC
From: eems@nlr.nl
Message-ID: <3n38mp$41q@liberator.et.tudelft.nl>
Source record: 167423

Hi,

I have a plain atari falcon 030 (4mb) with an ide and scsi.

I installed (put it in my autofolder) mint 1.12 and minixfs.
I formatted 2 30MB partitions on my SCSI with minit.
The minix partions seem to work fine.

But here are my problems.

When I create a filename with 3 dots '.' or more in it
(I tryed it to test the partition) and then call ls
(from tcsh 6.033) My falcon hangs.

This also happens when I try to move (or copy) a file from
a tos partition to the minix partitions, using mv (or cp).
Moving files from the minix partition to a tos partition using the
desktop works fine.

Also , yesterday I deTARed a tar file with gif's with CAPITAL letters as filenames
and ls hangs again.

I didn't install tcsh as far that it reads the login scripts yet but the paths
are set correctly.

What am I doing wrong?

Thanks in advance.

>parity enabled in firmware. Running BOOTFIX, which comes with the ICD

If it is one of the drives with _fixed_ parity-FW, running BOOTFIX or any
smilar thing wouldn't help you at all.

Only a change of the firmware would solve the problem. There were a couple of
Conner drives where this modification could be done, but I do not recall the
exact types, though.

Bye.

1003. Spectre GCR for Sale

Newsgroup: comp.sys.atari.st
Date: 1995-04-19 00:00:00 UTC
From: gaglenn@ix.netcom.com
Message-ID: <3n44mt$f05@ixnews4.ix.netcom.com>
Source record: 167426

O.K. I am lowering my price.

Spectre GCR with original box, documentation, version 3.0 of the software [most current], and ROMS for:

$125.00, plus shipping.

If you wish to make an offer for less than that, I am willing to listen. Send e-mail to gaglenn@ix.netcom.com

1004. PC Ditto II for free! [well.... sort of]

Newsgroup: comp.sys.atari.st
Date: 1995-04-19 00:00:00 UTC
From: gaglenn@ix.netcom.com
Message-ID: <3n45hc$fd1@ixnews4.ix.netcom.com>
Source record: 167427

Here's the deal. I sold my Mega ST which had PC Ditto II installed. The purchaser didn't want it so I removed it. Now I have this fully functional XT emulator and a, like new, IB Drive 5 1/4 inch external drive for the ST, in the original box, just sitting here and not doing me any good. The drive alone was over $200.00 originally. PCD2 will only work on a 64 pin rectangular [not square] 68000 processor. It will need to be connected by soldering a 64 pin connector [You will need to purchase this from an electronics store. They are cheap.] on top of the 68000 chip and just pushing the PCD2 pins onto the connector. Instant XT! Where does the FREE PC Ditto II come in? Buy my IB Drive for $50.00 and I will throw in the PC Ditto II, including all docs and supporting software. You pay all related shipping costs. First person to e-mail an acceptance for this limited time offer [until April 26, 1995] gets the goods.

email address is gaglenn@ix.netcom.com

1005. Thanks but ...

> these old VCRs were never cleaned and kept on running and running.

I'll agree that there' no certain way to evaluate a Samsung hard drive without having used one extensively, but Samsung's other products? Sheesh!!! Maybe they build good ships, but I'll take an exception to their VCRs and TVs.

I just got rid of my Samsung TV. It was VERY cheap new - as in $169 for a 19" remote (not stereo) with on-screen menu, etc. However, it worked for the warranty period and then got where every time it was turned on, it would be out of tune and had to be corrected with the fine tuning knob. Get it fixed?? No....at $169, they'd soon charge me nearly that much - and the money could be put towards a SONY or better brand TV. I sold it at a loss, but since it was so cheap to begin with, not much.

Samsung VCRs? I'd say that companies like SONY, JVC, etc are known for QUALITY VCRs. Samsung will always be down in the dumps with the likes of Goldstar and (the absolute WORST) EMERSON!! EMERSON SUCKS!! (back to the subject of Samsung, now). A friend of mine bought a Samsung VCR about 3 months ago for his daughter, at Costco. All it was used for was playing tapes, and not much. He set it to record and when he sat down to watch his program, all there was was sound and trash on the screen - recording was malfunctioned. Of course, it was outside of warranty by now.... Same deal. I've never heard any GOOD news about Samsung quality. If you have a Samsung VCR that works, good - it does what it's supposed to do like all other brands should.... that doesn't mean it's quality!

James

Source record: 167431

Hello,
I'm looking for a PD utility or accessary that will give me control
of an EPSON Action 1100 Laser printer. This printer emulates PCL 5 and PJC
language printers.
I'd much appreciate it if anyone could point me in the right
direction to find such a gem. Basicly what I'm looking for is something
that would allow me to send PCL and PJL code to my printer at will. I've
many older programs that fit like an old shoe, but they just don't support
the lengthy PCL5 codes for things like ,POWERSAVE, FORMLINES, <ESC>%-12345X,
etc.

Thanks,
Brian

PS...please respond via Email if your news reader offers the option. Thanks.

: >at ACE, but all in all it was fairly good. I just wish Shawn Tedder

: Frankly, I was _PLEASED_ that Atari wasn't there. In their absence, ACE was
: a computer show, not a Jaguar show.

I _wanted_ there to be a big presence of Jaguars there. The JAguar is
Atari's last best hope at the moment, in the absence of any computers to
market. Theyy need all the exposure they can get ... and the Jaguar is all
Atari has at the moment to offer the general public, and as such, they need
a strong userbase and some heavy exposure.

: I'd have been willing to see the Tramiel family (Three Stooges of Atari) show
: up at a dunk tank booth, however... If swimming out of the tank were a functionof their
marketing skills, these clowns would have died there.

Fortunately, it is not Atari that is marketing the Jaguar.

>are jumping directly from the ST/TT to another platform, insted of upgrading
>within the same platform when it's available.
>
>They're simply killing the market insted!
>

Along these same lines, it has been my PERSONAL (read- limited) experience
that those who own higher ended machines (especially the Falcons) are the
ones who are actually buying products for their computers. I had a second
hand 520 ST for three years without acquiring ANY new software- I used it
only for sequencing, and bought some second hand programs here and there.
I didn't understand why all the software cost more than I paid for my
hardware.

Now, I have a Falcon, and I am STARVING for new software. Case in point- I just
bought PinBall Dreams at the ACE show. I don't really care for pinball,
but just wanted to see the newest game for my Falcon, and support the
companies that made it possible. People who have the newer machines are
the ones who are spending the money. Most Falcon owners
I know have CD-ROM drives and decent size hard drives, and are on the
lookout for new products. In contrast, I know many people who have 520 or
1040 ST's, and they are collecting dust in a closet somewhere.

The Falcon hardware is definitely capable of competing with other platforms
for a few years to come (especially with 3rd part add-ons) . . .
The software, although scarce, is quite good
actually. I still have reservations about recommending Falcons to my
friends (who are definitely interested), because they must 'hunt' for
support. . . but for the right persons, the Falcon is ideal.

That's the way the Mac is, the 16th bit is used for alpha channel. NVDI will give you 15-bit display on your machine. I find it good enough for high end photo retouching, but obviously rendered gradients don't display as well as they would at 24-bit.

>thermometer on the HDD and onto the processor chip of the Mega to check.

The processor and the other chips in the MegaST don't get warm at all. Usually that is.

The only thing that needs cooling is the PSU itself. The Mega1 didn't come with any fan at all, only the Mega2 and mega4 did, due to the power consumption of the extra MegaBIT-RAMs.

I used to cut out the cover around the fan with a sharp knife. That helps a lot. Furthermore I got a nice PAPST-fan and built a little regulator curcuit (from German mag c't) to reduce noise even more.

Im my MegaSTE I have a PAPST-fan as well, without regulator this time, though. But I put a ~9 V Z-diode in series with the 12V-supply. That does a pretty good job. The same setup is working in my external SCSI-tower with the SyQuest and CD-ROM installed in it as well.

>the ambient temperature so don't do anything drastic until you have checked
>the electronic temperatures on a warm day!

The electronics itself is not the problem. But I would check the temperature of the harddisk. The Quantum in the MegaSTE doesn't heat up considerably. And the SyQuest stays quite cool, too (and it only uses 5 volts, btw.). The CD-ROM produces some heat (hardly to call "heat") after a couple of hours I can hardly feel the temperature difference from the airflow out of the tower.

Bye.

To all who are trying Oasis.

We are sorry for the troubles that people are experiencing :-(

Unfortunately we have two acts of God and on of BT acting against us,
Phil's TT blew its power supply, A hard disk corruption, My own phoneline has
been useless for a modem for just over two weeks and various last ditch
attempts at getting Oasis out in the last week drained us.

Even when we finally got it out we stupidly left a line of code used in
running the test version so Oasis100 becone Oasis101.

Now its out we find that the ST Medium Res resource has corrupted and
various extremely minor bugs that appeared in beta test, which we put to bed
ages ago are re-appearing.

Enough of this snivelling.

Please give us 2 days and correct these errors and we will upload
Oasis102 which we will make sure is as bug free as we can get it.

Again we apologise to any who have had trouble - if you aren't having
troubles please still upload the Oasis102 version.

Sorry again, Dave

>GIFs/JPGS, and play with the WWW the way it was MEANT to be used! You
>need modem speeds over 19.2k! you need CDroms... and software

And a large bank account to cover your phone bill if you are running from home.

I use my Falcon for various bits and bobs. I access the usenet via CIX in London and use an OLR (the most Excellent CixComm and CixRead).

I have used the WWW from work and frankly I wasn't too impressed - If I want to listen to audio and watch film clips then I can use my HiFi and Video - which gives better multimedia than any PC/Mac system ever built

CDroms like Microsoft Multimedia Beethoven ? Pile of crap IMHO - much better to spend the money on a CD of the symphony or even to go to a concert hall and hear the thing how it was supposed to be heard.

I spend all day working on a Digital Alpha 2100 server running X
so coming home to my Falcon is a pleasant change.

You complain about Atari 2600 humour and then basically descend into it yourself.

Just thought I'd share a snippet I saw in a computer paper at work today.

Intel and MS are working together on a new concept - emulating hardware in software. They propose such radical and revolutionary concepts as a software modem! Their first demo was a 16 Bit soundcard emulation - which used a modest 150Mhz Pentium!. The concept is that laptop users will be able to use sofware that needs soundcards etc without having the disadvantage of extra power consumption.

Somebody get the Falcon DSP software modem out and copywrited and then have a go at taking them to court

Steve ;-)

I was thinking of getting one of these to replace the 212Mb drive in my TT. However I have read that as it is a FAST SCSI2 device I will need active termination. ATM I use a passive terminator on the end of my SCSI chain which is a collection of fairly old SCSI 1 and SCSI 2 devices.

Anybody know anything about this - and/or active termiantion in general?

Thanks

Roland.

This comes around every few years or so - Sinclair was even in to this.
However what seems to happen is that somebody gives up and does it all in
hardware anyway to free up the CPU. Thats not to say that the new
'hardware' might not be a imbeded RISC processor and PROM, but whatever
the load is taken from the main CPU.

:-)

My TT video display used to go wobley due to heat. Pulling out the PSU (but leaving the fan in place) - and adding a new PSU and fan externally cured this. Twice as loud - but at least the machine is more relaible.

> Conclusion - if you want a reliable machine, leave the fan in.

Seconded. The fan might seem to be an anoyance - but its nothing compared to the pain in the neck when your machine fries one day. My system has anything from 2 to 5 fans depending on whats turned on. Sure its loud - but then it works reliably and anyway my headphones are plenty good enough.

:-)

Hi,

I am from Merlin in the UK, sellers of Substation. I can add a little to the previous message.

Substation will run on STE and Falcon with 1Mb of memory or more. It has a frame rate of 25fps and features the same great gameplay that OBSESSION, (Haven't got a copy yet, email for further details), had.

Substation never really claimed to be a Doom or Wolfenstein clone, more a 3D action game. In the next few days a demo will be appearing in some places.

If you want the complete breakdown of the game, I can email it to you.

Please email me at POPEMERLIN@DELPHI.COM

Hope that this helps

Phineas.

P.S. Substation details will go on general release on FRIDAY 21st April

> I recently re-installed superboot on my F030, everthing works fine
> except that it will not read in from the keyboard properly.

Rod,

SuperBoot was developed before the Falcon was introduced (and as I recall was abandoned before that point, too). It works OK on my TT but its color settings are off by a physical distance on the screen (you have to click in a different area of the screen to get it to register a click on a selection, for example), so even on the TT it's not quite right. You may want to look into XBoot, which does work on the Falcon.

In the meantime, if the only real problem is getting it to recognize keyboard input for password protection, there are password-lockout utilities around that will do the same thing.

I can't see any similarities between STR and AW layout. We use a new designer who has a track record with major UK publishers (like EMAP). The fonts are different, everything is different. As to Future's wizards - do you call those frightening mug shots of the writers good DTP work? You can clearly see the masking. AW spends more time and money on layout and photography which is clearly visible. Check out issue 2.

You will need a biger Power Supply that the one fitted to the STE, a Mega ST would do...

The smallest drive thing that I have seen is the Power Computing drives, they fit in a small 3 1/3 drive box and use a external PSU..

To me using a IDE drive is very very dumb, not much support and very little benefit, its far better to go the SCSI was, even the C-LABS Falcon has gone that way.....

Here in NZ IDE = SCSI II in price.....

TPH> That certainly is true. Another problem is the different video
TPH> system (especially in 256+ color modes). There's little hope that any
TPH> Falcon-specific software runs on any non-Falcon compatible computer
TPH> ever. I think that many problems are caused by compilers used, or
TPH> simply by program bugs.

Excuse me for saying that this is just stating the obvious. OTOH, there are a number of multi-platform computers in the works. The Eagle has already made it's appearance and a DSP card is due for it soon so that it will be able to run Falcon specific software. You'll also be able to mount other CPU's in the machine to make it compatible with PC and Mac software. Wizztronics in New York are also working on a 68060 based machine which will have PC compatibility via an on-board 486 chip.

TPH> The ordinary things... Studying, appearing stupid on Internet, and
TPH> bashing Macintoshes and PCs =-) ! And, of course, collecting dusty
TPH> LPs, trying not to look like an idiot when ordering a hamburger at
TPH> Georgian Mc Donald's (no success this far ;-) - and generally trying

SM> an individual sector it just tells me there is something wrong with the
SM> FAT. The only software I have than shows me the sectors is called Disk
SM> Doctor and I don't know if I can build the file from within here.

This has happened to me a couple of times. Oddly enough it was on my F
partition, too! Whatever you do don't write to that partition!

The only program I could find that would allow me to get into the partition
was Fast Copy PRO. In my case the problem was that the Boot Sector had been
wiped. I had to rebuild this manually by getting the relevant information from
the boot sector of one of the other partitions. You duplicate this with the
exception of the Hex number which gives the ID for the partition. The other
information relates to the size of the partition. Once this has been done you
can try copying FAT 2 over FAT 1. Compare the two using Knife first. If I'm
right they'll be different. This would indicate that only the boot sector and
FAT 1 have been overwritten. You weren't by any chance unpacking ZIP or LZH
files on your E partition, were you? If this works you don't even have to run a
recovery process on the individual files. You'll simply find that your
partition is back to normal.

If this doesn't work, the only thing I know of which will bring back any of
the files is Diamond Edge. This can usually only rescue straight text files
though. The other clusters usually have to much garbage mixed in to be able to
rebuild them correctly since you can't figure out what's what. It saves each
cluster. Unfortunately this usually means that bits and pieces of older files
are attached at the end of the rescue file.

There's a program called Diamond Back 3 which will allow you to save out
the boot sector info as a separate file so that the above problem can be easily
solved.

Good luck,
Tom

MB> True, though I would personally recommend Neodesk over these.

Having been a NeoDesk user for years (I did the Swedish translation of 2.5) I'd like to recommend giving no!desk a try. I've been using it for a couple of months now and find that I like it even more than NeoDesk4. It's MagiC, Mint and Geneva compatible and completely configurable via a script system and a number of built in tools. Unpacks ZIP and LZH directly from the desktop. Built in text and picture viewer. The only draw-back I can find is that it takes up between 700Kb and 1Mb in memory. This doesn't bother me as I'm running a 14.3Mb Falcon but it would present problems for people with less than a minimum of 4Mb. ;^)

MB> And from Universal Item Selector 3 and the like, must-have software
MB> anyway!

I prefer Selectric, myself. Freedom looks pretty good, as well.

Hello fellow Atari users! I own the game Ishar 2 and was wondering if anyone out there had played the game. The reason I ask is that I cannot figure out what to do on the second island, the town. Please let me know if you have any answers. How do you like the game?

Source record: 167281

B > Also...I would appreciate any information about upgrading to
B > Version 2.2. How much is it? What does it add or fix?

Good news on that front - SoftLogik did have the good sense to
offer a patch program to upgrade your version of Pagestream to 2.2.
That should be downloadable just about anywhere. I know it's on
GEnie.

B > Finaly, is there an ftp site that supports Page Stream?
B > Someplace where one could find things like import modules,
B > printer drivers, and so forth as they come out?

I would imagine the University of Michigan site should be able
to help you, as well as HENSA (shameless plug for Danny!:)) - both
have the good reputation of having lots of Atari-related files.

OTOH, you could also get in touch with SoftLogik themselves.
Although they're no longer developing for the Atari, they'd be able
to help you out with your font disk problem and any other questions
you may have - and they should be able to help you properly transfer
ownership of your copy of Pagestream to you once you showed you
owned a legitimate copy (as any good software house should).

Call them at 1-800-829-8608 or 314-894-8608. They are still in
business, they're running an ad in the new '95 Toad Catalogue!

The Falcon's ST Low emulation is achieved by line-doubling so it wont allow such things as 640x480 TC. There are, in fact, several SVGA monitors that are capable of displaying true ST Low and TC high res. There's one from Taxam, the NEC 3D you mention (although this monitor iss only produced for the American market nowadays), two Commodore monitors(1942S and 1960S) and here in Sweden we have a monitor from Datic. I don't know what name the latter goes under in other countries.

MG> around 60 pounds.

That brings you up to the CoMa voice level which includes a very basic
mailbox system.

MG> Coma professional, with a complex telephone responder system is more
MG> expensive, but that is a business strenght programm, and I don't need
MG> that. Nor do most other people.

This is the expensive one I was talking about. It includes a very complete
mailbox system which allows the downloading and uploading of files by a
restricted group of people with a password. I agree that most people don't
really have any use for this last level, but I thought I would give as much
information as possible. I took the information from the registration docs that
come with the demo so I have to assume that they're correct.

H> But you still haven't answered my question. Why do you think it was a
H> stupid idea to develop Magic for non-Falcon machines first? You don't
H> have to LIKE that decision, of course, but I think it was wisest.
H>
H> Or do you really believe that there are more Atari Falcon 030 machines
H> out there "in use" than all other ST/STe/TT machines?
H>
H> If so, methinks you have been seriously misled by someone's propaganda.

IIRC, the original discussion had to do with the premature release of *MagiC3* for ST/STe without Falcon compatibility. This was ramrodded through by ASH over the objections of B&B. There have already been two earlier versions of MagiC for ST/STe with version 2 being almost 100% stable. Now they have a relatively unstable version 3 about which there are many complaints and Falcon owners still haven't seen the program for their machine. Methinks it would have been better to have waited the two extra months and released a stable product which would have catered to the Falcon owners as well!

Cheers,
Tom

> ago.)

I've been told that to use MIDI you'll really need anywhere from
1 to 4 megs of memory. So you'll need to figure out if your 520ST has a
RAM upgrade.

Yes indeed there are PD wordpro's and terminal programs. ST Writer (Atari
Writer for the ST) is one that works fairly well.

The serial port has a bug in it that doesn't permit true 14.4
perfomance, although there are various hardware hacks and software patches
that can fix the problem.

A > included in the Pro Utilities, since they came out before the drive
A > was available.

I suspect someone will need to write some custom drivers for the Iomega ZIP drive because it comes in two configurations. One is a SCSI connection, which might be alright if you use a LINK or something. The other version of the drive will connect through the parallel port, and has a pass through so that a printer can still be hooked up to the computer through the same port.

The drive itself is light weight and can be easily be carried around with laptops. The price is around $300, and the 100 meg cartridges cost about $25.

It's a neat idea, I only hope is that it really works, and on more than just PC's and MAC's.

I had an Archive Viper 150 tape drive on my STe and Falcon. As the name suggests, it's a 150MB device, but can save 250MB on the right tapes, or more if the software supports compression.

For software, you can use tar/TapeBIOS (freeware), gemar (shareware) or Diamond Back 3 (commercial). I used the latter.

As it's a SCSI drive, you can use it with other equipment, I have used it with Mac and Unix too.

They're priced quite reasonably 2nd hand, as lots of Unix people upgrade to DAT.

There actually ARE some prof. people who's using MEDUSA's here in Europe.
MagiC3 is out for ST/STE/TT and soon in a native Falcon-version.

The EAGLE is also avaiable.

> IF the Eagle had come up at a
> reasonable price, I'd have bought one; it didn't, so I got the next best

It's quite obvious that you haven't got a Falcon, since there are actually some things where the Falcon is VERY capable. The Mac is good for normal productivity etc.

> I can put MagicMac into it to run "clean" Atari

It's possible but slow on a STe.

The Falcon is a lot more capable. 68030 at 16 or 32 Mhz and DSP56001 at 32 or 50 Mhz. 65536 colors on-screen.

> Something with the old-style 3D objects would work like Interphase...

: Eagle, Medusa) as well.

I doubt this very much. Programs which will probably not run on MagicMac but
will run on Janus, Eagle, Medusa, GEMulator and STonX are for example those
that rely on some ST-compatible hardware (e.g. MFP, Shifter registers), or
write directly to the screen (many games) or simply are incompatible with
Magic's TOS `emulation' (I don't know if this ever happens). But A. Kromke
should be able to explain what kind of software should be expected to
run and not run better.

Version 6.5.5 is the latest (and probably last!) version of the
ICD hard disk utilities. So, if it still supports SASI, I would suspect
that ALL versions do!

There may be a misunderstanding of what Pinhead does. It controls the way the OS handles fast loading, and is quite handy on any TOS version from 1.04 up. A Pinhead data file (PINHEAD.DAT) lets you determine which programs are not fast-loaded, and which ones get a different kind of fast loading -- how much memory is cleared.

One handy use of Pinhead is to make sure that the last program in the auto folder and the first desk accessory are loaded without the FL option. You do this by specifying those filenames in the PINHEAD.DAT file.

The only drawback I've seen in years of use of Pinhead is that it does not work with MagiC.

> What version of ICD is this, I don't recall a boot flag with 6.5.5...??

Robger,, any executable file has a set of flags. The problem with many flag-setting utils is that they won't let you change the flags of files that do not have the "official" executable extensions. Either changae the extension temporarily, or use NeoDesk 4, which has no such problem.

1076. Re: [HELP] Atari Laser Printer Cable

Newsgroup: comp.sys.atari.st
Date: 1995-04-20 00:00:00 UTC
From: bm827@FreeNet.Carleton.CA
Message-ID: <D7C5BG.EIE@freenet.carleton.ca>
Source record: 167317

The only way I know of to use your Atari laser with an IBM is to use an ST as a "slave". If you use the Atari driver (Diablo 630 emulation), apparently there is some way for the input to come in through the serial port and out through the DMA port to the printer. You would therefore send your text, output, etc., from your IBM through the ST to your printer.

I don't know whether this would work with LaserBrain (Epson 9-pin emulator) or not.

1077. re: conner hard drives

I also have a Conner that is "quirky".

When it is hooked up to an ADSCSI host adapter, I have to boot off a floppy to get it "recognized" the first time. After that, the drive will autoboot after a warm reset.

When I tried it with my Mega internal mini host adapter, the drive was not "recognized" at all.

Both of these host adapters are made by ICD and work perfectly with Seagate and Quantum drives.

The only "fix" I have found for the Conner so far is to "chain" it to another non-Conner drive or even to another non-Conner SCSI card (without the drive attached! - kind of a waste of a SCSI slot, though).

I have no explanation for this phenomenon.

: the release date in the U.K., well..... what's it like?

: How does it compare to REVIEW?

: If someone has the time, I'd like to see a reasonable in depth review
: of it.

The first thing to hit you about Atari World on the news-stand is the size of it. As most magazines have moved to larger than A4 (the American size I believe) and have a 'square' bound spine on them, Atari World seems very small and wimpy in comparison. Its on A4 print and stapled together, the three magazines are held by a plastic strip which isn't the most secure thing ever and due to the glossy covers of the magazines they can slip and slide out of the strip, indeed I know some people who never even got the extra magazines.

You get 3 magazines, Atari World, Atari Pro and ST Source. However both Atari Pro and ST Source are only around 15 pages in size, which makes you wonder if they can be counted as magazines in their own right. There is no cover disk, but they have a 'Reader disk' option, whereby if you like the sound of the software in that issue and on the disk you can order it for 2.50 sterling (it might be more if you live outside the UK). The contents of the first disk include mostly utilities like ST-Guide and various others, a nice mixed bunch but I think lots of people will have them already.

The layout and DTP work is identical to ST Review, even down to the screen grabs and photos in some cases. This isn't a bad thing however, sure it doesn't match the layout wizards at Future Publishing, but its cleanly presented, readable and well set-out. The font used is rather small sometimes but nothing a good pair of glasses won't sort out B-)

I might have seemed to be very critical so far, but please remember I am only talking about the cosmetic aspects of the magazine. The content itself is completely top-notch. There are 7 pages devoted to reviewing lots of nice and NEW public domain and shareware software, all with screen grabs where suitable. The News section is very good with lots of snippets that I've even not seen in these Usenet groups before. There are reviews of Cannon Fodder for the Jaguar, this is probably the only article that could have been left out, but its only a page and does have some nice screen shots. They preview Team a new football game (a demo of which is on ST Format this month, and bloody good it is too). There are also articles on the aspects of programming which is good, review of the Maxis drive, an 'interview' with Neil O'Nions of Compo (also the

published of Atari World). A -very- good Question and Answers section, a well drawn but rather unfunny cartoon strip ;) and lots of other things.

Another point in its favour is the amount of advertisements, there are loads of them all over the place! I think this is a good thing because I know for a fact that people do like to read the adverts and gaze over the hardware they dream about :) I for one purchased my new hard drive from an advert in Atari World that had not been printed in ST Format. Nice one guys!

All-in-all its a vital source of Atari information and well worth supporting, there must be around 115 pages when put together and they sure pack a lot into the first issue. Lets hope they can be consistent. It might look like a pull-out section from Computer Shopper, but its a damn fine magazine, you won't regret buying it.

As of tos 1.04 up, you can set the fastload flag of a program using some file utilities. There are lots of such utilities around like MaxiFile, proginfo, flagset to name a few, which will do that. You do not need pinhead in this case but I read somewhere that pinhead does a better job at this (maybe it's pinhead doc itself).

Ah, the innoncence of youth. :)

JT, aka John Townsend, is none other than the 'TOS God,' a moniker he earned from leading the Atari TOS development team for the famous Rainbow TOS 1.4 (or more correctly, 1.04).

We owe a lot of the 'good stuff' on the Atari directly to John.

JT now works for a little start up company known as Taligent and he even pops in here, from time to time. <Hiyer, John>

> software producers/distributers "FORGOT" to support it.

Oh, please... The above statement has got to be some of the most idiotic tripe I have EVER heard on the nets (and that's a lot)!

Do you REALLY think that Atari software developers 'forgot' to support the Falcon? Are you SERIOUS about this statement? Truly? Really?

Look, I don't know the Applications Systems gang (the MagiC developers) at all, but I can well imagine that they did -not- enter into business with the intention of losing money or, amazingly enough, specifically to antagonize Kim Anderson and other Falcon owners (such as myself).

If their software does not currently support the Falcon, you can bet it is NOT because they 'forgot' about the Falcon's existence. There were obviously some serious problems in getting MagiC to work with the Falcon. Rather than waiting until all those bugs were ironed out, they released the ST/TT compatible version so they could gather up some sales while working on the Falcon version. Remember, the Atari market shrinks a little more every day so it's important to get a _solid_ product to market as soon as possible. Like they say, time is money.

It is unfortunate that Systems Applications does not have your vast years of business and marketing experience to rely on, otherwise they might not have 'forgotten' about the Falcon. Yeh, right. ;-)

Do we need more Falcon-specific software? You betcha. No argument there. Can a software company make a decent profit developing and marketing a Falcon-specific software item? Maybe, but it's definitely risky business and getting worse every day.

Get a SCSI-II to SCSI cable, plug it in and reboot your Falcon.
AHDI will recognise the drive automatically and you can then install the
device from desktop as per usual. Well, it works this way for me and I
don't even use ICD PRO.

That's quite a common thing to do so that you get a uniform number of
bits for each channel. The ET4000 version of NVDI has 15, 16 and
24-bit modes so I guess that NVDIMac will have something like it as
well.

Well, I don't know much about using NVDI, but I do have it. The thing is that with MiNT, ST High is just fine since it is mostly text based and MintX needs ST high (although I have heard of people using TT high). So use Superboot (like you mention in a previous post) with a mostly correct display, I have the machine *BOOT* in ST high. I am talking right as the computer powers up (I have tried the NVRAM programs, they don't seem to make a difference in how the machine boots, plus they are in German so maybe I don't understand what I am doing). So, My HD drivers have the screen in TT Medium, then my first autoprog puts the display in ST High, followed by Superboot configured correctly for an ST high screen. The autoprogs I select then run in ST High (mostly TOS Fixes and TSR program welcome screens). When my desktop comes up, it is in whatever resolution in which I created NEWDESK.INF.

The best side effect is that if I choose MiNT to start up (not Multitos, because then the above applies when the desktop comes up), the screen is still in ST high, perfect for running MiNT-X.

Since I just bought my TT less than a month ago, there are many things I don't understand about it, or the software that came on the Hard Drive.

From: Jackdeth@cris.com
Message-ID: <3n66da$4oo@warp.cris.com>
Source record: 167335

I want to buy a new hard drive for my ST. I used to have an 80 meg seagate, but sold it some years ago. I haven't checked into drives to use on the ST for some time. I want a complete unit I can just plug in and use that is in the area of 100 to 200 Meg. What are some reliable HD set-ups being sold for the best price?

> Linux should work on Falcons, too. You'll definetely need the FPU,
> though. But that's not too much of a hastle to install.

I can't get it to work on my machine. I have IDE but _no_ SCSI. I believe
that adding a SCSI unit solves the problem, but I do not intend to buy one.
This applies to the latest patches, including the CD one.
Regards,
Ian.

] GC> disconnect the fans? The more annoying one is the one on the hard
] GC> drive, but it seems to me that nothing there gets warm at all; I am
] GC> somewhat less sure about the computer itself. Has anyone tried
] GC> this? Thanks un advance for any tips.

This subject has come up in this newsgroup several times, and I
feel I must make some comments about it.

] Electronics is usually safe up to 50 deg. C. You could stick a
] thermometer on the HDD and onto the processor chip of the Mega to check.

The above is a bit of a sweeping statement. In fact, the junction of
a bipolar transistor will work up to about 150 degrees C, although I wouldn't
recommend operating it that hot. Most commercial ICs are rated to work at
85, or sometimes 125.

A thermometer could be used as suggested above, but it wouldn't
necessarily be the processor that is the problem. Other ICs, particularly
driver chips, may get hotter. The hard disc itself may be affected by high
temperatures. The power supply is sometimes the most vulnerable part.

In general, think of it this way: Electronics companies go to a
good deal of effort to make their products as cheap to make as possible.
This will even encompass searching for a component that may be just 1 cent
cheaper than what they're using. Hard drives and computers are sold in their
millions. A 1 cent saving makes a lot of difference millions of times over.
An electric fan, however, costs several dollars. If they make 1 million disc
drives, they're not going to spend several million dollars putting fans in if
they're not really sure whether it is necessary or not!

Conclusion - if you want a reliable machine, leave the fan in.

] At one time I saw a simple circuit using a thermistor which would only
] switch on the fan if the temperature was getting too high. A lot depends on
] the ambient temperature so don't do anything drastic until you have checked
] the electronic temperatures on a warm day!

You could do this, but how do YOU know where to place the thermistor.
That is, do YOU know what part of the whole circuit is most likely to fail
at a high temperature. It won't necessarily be the hottest bit.

Sorry to dampen your idea, but if you want to keep your computer,
I'd leave it alone! And for all the people who are going to reply to this
saying "I took my fan off and everything works fine", I say, "Good, I'm
glad it's OK... at the moment. It doesn't mean everyone's will be though."

>behind, (if you know what i mean).

(1) They have clearly said that Falcon support is on the way. Just because
they released a version without it doesn't main that they aren't working
on it.
(2) The number of Medusas sold is a nearly neglectable market. And the
Eagle developers claim to be TT compatible, so MagiC should run right
away.

1100. re: question about tape back ups

On 20 Apr 95 Rhett wrote::

RS> wondering what tape backup systems are known to work with the STe
RS> (mega4) and what software works well with them.
RS> personal experience, technical advice, etc etc are all welcomed.

My kit is a 1Mb ST but I reckon the m/cs are close enough for my experience to count.

I have a Supra host adaptor and recently bought a used Archive Viper 2150S streamer. It says it holds 150Mb but contacts have said the is no bother if you use the longer 250Mb tapes.

For s/w I have tried Diamond Back 3 (Hi-soft about £40) and GEMAR (Shareware).

While I prefer the user interface of DB3 it has given me some problems, mostly timeouts while searching for tapemarks. GEMAR ddoesn't give this problem.

DB3 has only one streamer feature which the user can modify, the ability to do "immediate" commands. Apart from this the s/w appears to try to be clever and work out the best way to drive the device. By contrast, GEMAR has set-up files for different streamers which allow user tailoring of most of the important parameters.

I have talked to Hi-soft about the DB3 probs. and they were surprised I was having trouble with such a common streamer as the Archive. Maybe the trouble is in the h/a. I haven't taken the investigation further as I am now quite happy with GEMAR which, weekly, backs up 68Mb in 25 mins.

I think it was me saying it was stupid, and i didn't mean it was stupid
to develope Magic for a non-Falcon machine. It's stupid not developing
Magic for the Falcon, and then make it backward compatible, _IF!_ it's
needed, (which it probably is for an start).

>
>Or do you really believe that there are more Atari Falcon 030 machines
>out there "in use" than all other ST/STe/TT machines?

Thats not the point Hutch, (you should know by now).
I got no exact details of how many Falcons has been sold, but who do you
think are going to carry the Atari computers out in the future, (if there
is a future ofcouse) ? It's not going to be ST users, thats for sure.

Many ST users sold their old machines to buy an Falcon. What do you think
is going to happen, when the old ST is getting the support. I'll tell you.
The Falcon owners will simply change platform, cause they're not going
back to an ST, and there is no reason to stay with the Falcon anymore.

Insted 2B could have chosen to develope Magic for the Falcon, and perhaps
some new Falcon owners would appear. And if there was a need for it, they
could have made an ST version as well, (if they really needed the money).

THATS how anyone else would have developed software, if they cared ofcouse!

If there isn't a future at all, then it really doesn't matter what machine
anyone is developing for.

>
>If so, methinks you have been seriously misled by someone's propaganda.

Okay Hutch, perhaps it's time you tell us how many Falcon owners is out
there, cause you sound like you got the number ? Otherweise your argument
doesn't hold it's state.

>
>Er... IMHO, of course. ;-)

I sure hope so.

I already hate it.. Nah, i did hate before i got it, but to be able to run
a decent Internet application i need this machine, (Internet In A Box).
Unfortunatly it also means i got to run Windows, which is one thing i
really hate.. But i'm used to live in hope, so maybe someday this application
will be made for OS/2.

I'm not trying to convince anyone that the PC is good.. It's just damn
easier to get software, (read, support), insted of this Atari thing. But
as far as the Atari goes, i've stopped hoping for anything. With programmers
and software distributers like 2B and Heidleberg, it's waste of time hoping
for anything.

The other way around is normally the way to do it, but i guess i would be
kidding myself trying to convince an Atari market about that.

>Well, methinks your analogy is a bit weak here. There are enough machines
>in use in any ONE of these categories (286, 386, 486) for a company to
>theoretically survive by supporting that machine alone (not that they
>would want to, of course, but it's possible). There simply are not enough
>Falcon030s in use to support a single-product company for very long.

Ofcouse it's possible, but why do you think nobody is doing it like that.
As you said, it's a matter of profit. There is NO profit in making an
application for a 286, but there is profit in making an application for
a 486/pentium. And making it backward compatible means more profit.
And it'll also make people upgrade their hardware!!!!
Anyone who can't understand this got a really bad problem.

>
>This is all academic, anyway. Companies will frequently do something that
>the user doesn't like or does not understand but there is often a very

Ofcouse, and there is alot of things out there i don't agree with. But
it doesn't mean i have to agree. And when i don't, i usually say so. (don't
ask me why.. I guess thats how i'm build 8)).

1118. [HELP] Atari Laser Printer Cable

Newsgroup: comp.sys.atari.st
Date: 1995-04-20 00:00:00 UTC
From: "Thi X. Nguyen" <tinguyen@aimnet.com>
Message-ID: <3n5593$4g2@aimnet1.aimnet.com>
Source record: 167450

Dear ATARIans,

Does anyone figure out how to make an Atari Laser Printer (for Atari ST4 computer)
work on non-Atari computer ?

I was given an old Atari Laser that has a 37-pin female connector and I can't find
an adaptor that would connect it to my PC's 25-pin parallel port. (see attached)

Thanks a million.

: Unfortunately, even if you have the pinouts for what sounds like an Atari
: ACSI DMA port connector, it will do you little good.
:
: The Atari laser printers were the first to use the _computer's_ memory to
: raster the printed page, as opposed to having memory installed in the
: printer itself. Translation: Atari laser printers are directly compatible
: with nothing else in the world but an Atari ST/STe/TT computer with the
: proper GDOS driver software. Unless you have the time and motivation to
: write your own driver, and I have _no_ idea where the information one
: would need for that would still be available.
:
: However, just in case, you might ask your question in comp.sys.atari.st;
: it's possible (though unlikely) that someone else has figured out how to
: make an Atari laser printer work on a non-Atari computer.

Hi Shannon,

>I'm looking for a DOS program that will read and write Atari ST DD disks.
>Does anyone here have
>any suggestions? I'm also looking for a Atari ST utility to read and write DOS
>disks.

This should be in the Atari FAQ.

IICR, there is a program called ST2DOS.EXE that will make ST formatted
diskettes readable on DOS machine. I however do not recommend this method, as
it actually modify the boot sector of the diskette, which IMO is dangerous.

ST can read any DOS disk as long as it's DD. Just pop them into the ST drive,
you do not need as utilities. For best compatibility, format your DD disk on
an PC. This is because DOS machine needs to have special bytes in the boot
sectors to read, while ST don't.

If you want ST2DOS try one of the Simtel CDROMs.

>have made an ST version as well, (if they really needed the money).

Hahahaha... what Atari developer does NOT need the money? :)

>THATS how anyone else would have developed software, if they cared ofcouse!

If they cared? About what? As a business they care about being successful.

>If there isn't a future at all, then it really doesn't matter what machine
>anyone is developing for.

Bingo! The light dawns. But of course there is a future... it's just not
likely to be the one people (Atarians) would prefer. ;-)

>Okay Hutch, perhaps it's time you tell us how many Falcon owners is out
>there, cause you sound like you got the number ?

No, of course I don't have THE number of Falcon owners. No one does (even
though I think I've got a good idea). But it shouldn't take a rocket
scientist to estimate there are more ST/STe/TT machines in use than there
are Falcon030's. Ask others for their opinion, if you wish. I don't care.

However... I DO care when you start calling Atari developers stupid and
try to blame them for the current and future state of the Atari market.

I use the term 'IMHO' frequently in my posts. I suggest you do the same.

>Pro 2.1, Quicken 5.0. Can I run America Online software with GCR?
>- Steve

My advice: Get the used Mac SE. My reasons for this are:
1) Gadgets by Small, manufacturer of Spectre GCR, has declared bankruptcy and no longer supports the product.
2) Although I understand that Spectre GCR was very stable on older STs, I have experienced problems on my Mega STe, and I have heard from others who also have experienced problems with STe's. Mainly, there is a problem with reading and writing Mac disks. I and others have found that the only semi-reliable way to get Spectre GCR to read and write Mac disks is to format a disk in Mac format before launching Spectre GCR application and going into Mac mode. Some technical reason for this having to do with differences between ST's and STe's that makes Spectre less compatible with STe's (although I have heard some say that they had NO problems with Spectre GCR on STe's, so you figure!). Also, many people, including myself, had a very hard time installing Spectre GCR on their STe.
3) Spectre GCR only supports Mac System/Finder 6.X, not system 7.X, and most of the new software requires system 7.
4) Spectre GCR only supports 750k disk drive, not 1.44mb disk drive. Most new software requires 1.44mb drive. You can get around this by compressing files with such software as Stuffit Lite, but believe me, it's a hassle.
5) Spectre is just an emulation, albeit a pretty good one, so you will experience the inevitable bugs.

Having said all of that, if you can get a used Spectre dirt cheap and you don't mind taking a chance and experimenting, I say go for it. I personally use older versions of Mac software like Word 4.0 (my company has a licencing agreement with Microsoft that allows me to put a version on my home computer.) I can then write files back and forth between my work computer, which has Word 5.1, and my Mega STe. BTW, America On Line does work on a Mega STe using Spectre GCR, although I have to use AOL software version 2.1 rather than the newer 2.5 (see items 3,4, and 5 above). Another thing to consider: A used Mac SE is a fairly outdated machine in itself, so you may also be frustrated with its limitations, as well. $250 is cheap, however.

BJ> Come on!! How many ST, MSTE and TT's are sold!! I think it a far more
BJ> bigger market for our old mashines than it would be for a program that
BJ> only work on Falcon. And hade they released the Falcon version before
BJ> the ST version then you hade not said anything.

I didn't mind that they released the ST-STe-MSTe-TT version first. I just
get irritated when they released 3 ST-STe-MSTe-TT versions first after
promising a Falcon *compatible* (not even *specific*) version for over a year.
We'd like to try the new system, too!!

> platforms have droped by the way side, Facts can't lie....
Do you know why everybody uses the VHS system and not Betamax or Video2000? VHS was never the best but the company behind that product was much bigger. And where do you think would IBM, resp. MS DOS, be today if they didn't had their network in the US for selling and supporting their office machines before entering computer business?

Actually, after the novelty of the cute screen savers wore off, I found that
I disabled them anyway. They _SERIOUSLY_ slowed down the throughput I was
experiencing with STalker & ZModem & Falcon.

Jaguar's sales are living proof that the Tramiel Schlamiels haven't learned
a thing in the 10 years they've been grinding Atari Corp. into the mud.
The only hope Atari has of surviving is that someone would come along and
buy out the current owners, The Three Stooges.

>Fortunately, it is not Atari that is marketing the Jaguar.

You've got that right. Atari isn't marketing the Jaguar at all...

1145. Upgrading 1040ST ram - how?

Newsgroup: comp.sys.atari.st
Date: 1995-04-21 00:00:00 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <FDVQDBVAUp@stingray.manawatu.gen.nz>
Source record: 167205

How hard/easy is it to upgrade the memory in my 1040ST? It's TOS 1.02,
and very much standard (no hacks or anything done).

I'll probably buy another computer near the end of the year (or sooner if
the company buys it for me), but I'd like 4Megs in the mean time - I have
only 1Meg at the moment, and it's a damn nuisance. I won't be using it for
any games - I have an 8bit atari for that =8-]

Pref. please don't suggest places to buy anything, as I don't want to have
to send overseas for stuff. I just want to be able to plug something in,
or remove chips and replace with 4Meg ones or something.

Any help would be most appreciated.

Thanks,
Richard =8-]

PS. Please no suggestions about upgrading my TOS, as I don't want to spend
money particularly - just enough for RAM =8-]

Yes NEODESK 3.x was OK but the new version they added far to much,
to cluttered and I don't need a Kitchen sink in my Atari.

I stoped using NEODESK 4 after 3 days, it was also far to slow to load and
has bad memory fragmentation problems, even with the patches...

Sorry Gribnif but you boobed that time.....

Inactive but not dead. CodeHead Technology is -not- closed down and
out of business. John Eidsvoog sez people just won't let them quit. :)

It's true that other things have taken priority in their lives. Charles
has been touring with Percy Faith (and others I can't recall) and John's
music career has been active too from what I understand. It looks like
Tomas is pretty much holding down the fort for them, albeit remotely.

Atari Web Pages Latest News
~~~~~ ~~~ ~~~~~ ~~~~~~ ~~~~

Version 1.0
~~~~~~~ ~~~

Date 21/4/95
~~~~ ~~~~~~~

by

Mark Stephen Smith
~~~~ ~~~~~~~ ~~~~~

5th Update
~~~ ~~~~~~

================================================================================

Foreword
~~~~~~~~

Hello and welcome to the news item on the Atari Web pages. This document
will describe the Atari Web pages as provided by Mark Stephen Smith and will
inlcude a list of the latest updates for the month. Each month I hope to update
this text with the very latest additions and news on the Atari Web pages.

Hopefully these pages will provide an invaluable service to their users, but
they are still at an early stage and developing all the time. As such any
feedback and support you may have for these pages is more than welcome, it is
infact encouraged. The more input I get from its users the better, as then I
will know what is good and bad about these pages and can change them
approproately in the hope of increasing their value to their readers.

Now on with the show.

================================================================================

News and Changes
~~~~ ~~~ ~~~~~~~

Well since the original description a lot has happened. I'm now involved in
several projects, and submit work to several Internet and diskmag sources for
inclusion. I have also officially took over the maintenance of the Atari FTP
list from Hallvard Tangeraas of which there have been a couple of updates.

New items in this document since the last copy will be marked with **, updates
will be marked with a U. All new items are also listed below according to the
date they were added.
```

This update is special as it contains the updates from the last two months rather than one month as is usual for the updates. This is a one off however and has happened due to the fact that my Web pages had to close down in March and a new site had to be found before the service was resumed. A new site was successfully found but I felt there were insufficient updates that month because of these events and therefore this update is larger containing both months. Please make a note of the sites new address and update any links or bookmarks to the Atari pages to the new address. Thank you!

The new items this month are:

21/4/95 -- Nova Graphics Board Announcement
21/4/95 -- Sozobon C Announcement

==========

What are the Atari Web pages?
~~~~ ~~~ ~~~ ~~~~~ ~~~ ~~~~~

These are a collection of pages covering all formats of the Atari. In these pages may be found the latest news, reviews, software for downloading, and various other information and links to other places of interest to Atari users.

I have tried to make the structure of these pages easy to follow and as intuitive as possible but there is still a lot of work to be done yet.

==========

How do I access them and what is the Web?
~~~ ~~ ~ ~~~~~~ ~~~~ ~~~ ~~~~ ~~ ~~~ ~~~

First of all I shall look at what the Web is or to use its full name the World Wide Web. The Web is new way of accessing the Internet, unlike previous methods where you were required to enter commands into the program you were using the Web uses a more user driven method of getting around the Internet. This method is much more graphical than former methods and as such is much easier to get to grips with.

When using a Web browser (the name given to a program used to access Web pages) the control method usually consists of a point and click operation. A Web page will consist of text and graphics which are sometimes highlighted in some way to indicate that they are selectable and link to more information or a particular piece of data.

Such a link is reffered to as a hyperlink. In fact the whole system is a variation on hypertext and uses a script to create each page. Each script is written to a HTML (HyperText Markup Language) standard which contains the main body of text in the page and a few command tags for the browser as to how to format the page and what to do with links, etc.

Web pages may contain text, graphics, sounds, and animations, although the later two are normally supported through external software. It is also possible using the Web to gain access to newsgroups, ftp sites, and gopher services all through the one program. As such this makes this a very powerful tool for Internet access, and coupled with its ease of use this has suddenly became the big thing in the recent Internet explosion into the media.

Browsers can handle all properly written HTML scripts but may vary in operation when scripts are incorrect or contain mistakes. Browsers can be divided into to distinct types, graphical and text only. Popular graphical browsers include

NCSA's Mosaic and the recent new browser NetScape. On the text side Lynx is the most popular textual browser (NOTE: text browsers don't show any form of graphics).

To access the Web you must either use one of the above mentioned browsers on a machine such as a Sun, PC or Mactintosh, or if you want to access it via your Atari you will need a copy of the Lynx browser as unfortunately there aren't any graphical browsers YET for the Atari.

==========

U Where do I find the Atari Web page?
~~~~~ ~~ ~ ~~~~ ~~~ ~~~~~ ~~~ ~~~~

From your Web browser choose to open URL and enter the following address:

http://www.mcc.ac.uk/~dlms/atari.html

If you can store a hotlist of addresses or something similar on your browser then it may be worth including this address for quick access in the future.

Once you've done that you should see my main page so I hope you enjoy it, and don't forget to write with your thoughts.

(*NOTE*: This is the new site for the Atari Web pages, take note of it!)

==========

U What you will find in the Web pages every month.
~~~~ ~~~ ~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~ ~~~~~ ~~~~~

From the main menu you have several links available to you, some under miscellaneous and others specific to a particular machine, or collection of machines. It is now possible to mail me directly from the Web pages, special thanks also to Frank Charlton for the new Atari Logo. First I will look at what will be in the Miscellaneous section.

Atari Related links, Documents, FAQ's and Newsletters
~~~~~ ~~~~~~~ ~~~~~ ~~~~~~~~~ ~~~~~ ~~~ ~~~~~~~~~~

First in the list are "Atari Related Links", these links are to other sources of Atari information or data (such as files, etc.).

There is a link to many of the major Atari holding FTP sites on the Internet. Links to several Web pages by different people on the Atari. This will grow as worthwhile sites come up. At the moment you can visit:

- HENSA to download Atari files (Moderated by Denesh Bhabuta)
- ZFC's Atari Pages by Annius V. Groenink. This has links to various Atari related places, along with talk of his own work on Edith and his new Drive U Project. Annius is also working on a version of the Mosaic browser for the Atari and the best of luck goes to him on that.
- Christer Gustavsson's Atari Gem Programmers Page. Very useful information for
~~~~~

programmers grapling with Gem and the operating system. Also offers help via his questions answers page. Some links can be found to Atari related places.
- CAIN Atari Pages. CAIN is the Central Atari Information Network and they create a newsletter which is updately monthly on all things new to do with the Atari. There are also links available here.
- Martin Maisey's Atari Pages. Contains information (downloadable) on programs written by himself for the Atari. Again there are links to other Atari places.
- Toad Computers Pages. Stockiest and retailer of many Atari goods.
- ST Format Pages. Information and previews of ST Format issues.
**Volker Burggraf Atari Pages (German).
**Desert Star Software Home Page.
**ST Assembler Page
**BSM's Home Page
**ST Beer Mat Page
**The Organised Chaos Licenseware Home Page
**Index of /~jschlich/Jaguar/
**Lynx Pages
**Atari Lynx Page
**Atari Page by Frank Post (Partially German, partially English)
**MiNTOS Distribution and Information Page
**Julian's Atari Page
**Atari Ghostscript
**Atari Page by Robert Krenn
**Simon Gornall's Atari Pages
**Ben Halls Page (KSculpt + Calamus Information)
**"Data Uncertain" Software
**Kay's Home (MintNet)
**CNAM Atari Pages
**EMAGIC Users Page (Covers Atari)
**Helmut's Project contains Atari Links (English and German)
**Eero Tamminen's Atari Pages
**Atari Programmers Page
**The Vulcans Home Page
**Atari Users List
**Impulse Home Page (Demo Crew)
**NPG Home Page (Demo Crew)
**Atari Page by Dirk Klemmt
**Steve's Atari WWW Pages
**The Guitar Reference (For the Atari)
**Musings of an Amateur Hacker
**The Atari Home Page by Martijn Dekker
**Tecnation Sonovista (Falcon based computer)
**Cybercube WWW Page (Atari Products)
**Yak's Zoo
**Atari Jaguar 64-Bit Game Machine Stuff
**8 Bit Atari Page by Ivo van Poorten
**Atari Jaguar Homepage by Christian Svensson (very good and kept up to date)
**Jaguar directory

Documents
~~~~~~~~~

Useful documents will appear in here. At the moment there is:

U Atari FTP List by Mark Stephen Smith (essential for the latest news on who provides Atari FTP sites).
- Atari TOS Desktop Survival Kit by Thomas J Hopper. An essential guide to getting the most out of your DESKTOP.INF and NEWSDESK.INF files.
- Recommended list of software for the Atari by Denesh Bhabuta. List compiled by Denesh for me of his best software for the Atari (updates coming soon). Mostly PD and Shareware, this list contains links to download most of the software mentioned.
- Information on picture formats by Dave Bagget. Lots of information on the format of different picture files for the Atari.
**Information on Viruses.

FAQ's (Frequently Asked Questions)
~~~~~ ~~~~~~~~~~ ~~~~~ ~~~~~~~~~

Useful FAQ's will appear here. At the moment there is:

- Atari ST SLIP FAQ. This is a guide to connecting your Atari to a network. All you want to know about networks and the Atari.
- Atari CD FAQ. Information on getting and using CD's on the Atari. Regular updates to this can be found in my pages.
- GDOS FAQ by Gerd Castan. Got a question on GDOS then this is the place to look.
- MiNTNet FAQ by Christer Gustavsson. Everything you wanted to know about MiNTNet.
- AtariNOS FAQ by Frank Charlton. Answered questions and information on NOS.

Newsletters
~~~~~~~~~~

Although there may be more to come the following newsletters are updated promptly as I receive them. These have been re-organised to make it easier to keep track of. At the moment there is:

U CAIN Newsletter containing the latest Atari news.
U HENSA Newsletter containing the latest updates to the HENSA Atari archive.
U AEO Newsletter containing the latest Atari news.

Newsgroups
~~~~~~~~~~

Atari related newsgroups. Send updates. The currently supported news are:

comp.binaries.atari.st
comp.sys.atari.advocacy
comp.sys.atari.announce
comp.sys.atari.st
comp.sys.atari.st.tech
comp.sys.atari.programmer
rec.games.video.atari

alt.games.lynx

****

U Questions and Answers
~~~~~~~~~ ~~~ ~~~~~~~

Submit your questions to here and get them included in this page. Answers are open to anyone who has something valid to say, and help is provided to me on Programming and Music questions by several knowledgeable sources. Please support this section, only by your interaction and questions will it survive. All answers are included in this page for anyone else with the same question and answers are also sent back to the person who submitted the question for those without Web access.

If you feel you have an expertise in a particular area concerning the Atari and would be willing to answer questions on that area when and if I submitted them to you, then please let me know and you can join the team. Programming and Music are fairly well covered and I can cover Graphics programs, help with Technical questions would be appreciated.

****

Reviews
~~~~~~~

Here I hope to include reviews of Atari products both new an old. So far I have the following reviews:

- Kobold review by Andy Curtis (ST Format)
- Flash 2 review by Frank Charlton (ST Format)
- Edith Professional review by Frank Charlton (ST Format)
- MagiC review by Andy Curtis (ST Format)
- Stello v2 review by Mark Stephen Smith (Myself)
- Sportster Modem review by Frank Charlton (ST Format)
- Storm Tracker review by Andy Curtis (ST Format)
- Connect review by Frank Charlton (ST Format)
- Zero 5 review by Frank Charlton (ST Format)
- MIDI Grid review by Andy Curtis (ST Format)

There are several reviews on the way by the above mentioned people aswell as some by myself. This section is now growing well now and Nick Peers from ST format recently expressed his interest in writing some reviews also.

Again if you feel you would like to submit reviews for inclusion then please write to me. Please note these pages don't include Lynx and Jaguar Reviews, as they are contained within their own pages.

****

News and Announcements Pages
~~~~ ~~~ ~~~~~~~~~~~~~ ~~~~~
~~~~

Latest Atari news, and announcements from the Atari World. Currently contains the following:

**Nova Graphics Board Announcement
**Sozobon C Announcment
**FTP site Announcment
**Fried Bits Eastern Coding Convention 3 Announcement
**Portfolio Club Announcement
**Towers II release Announcement
- Universal Virus Killer Book Announcement

****

Updates and Information on these Web Pages
~~~~~~~ ~~~ ~~~~~~~~~~ ~~ ~~~~~ ~~~ ~~~~~

All updates and news on the Atari Web pages goes in here. Previews of whats to come soon are included and new items or updates to the pages are listed according to date with the most recent being first. Most updates contain links to the new material for instant access.

Other things to be found in here are the number of accesses to the Atari pages. At the moment this is not supported.

****

This now concludes the Miscellaneous section. Now onto the Other Pages. These pages are specific to a particular machine, or collection of machines. These are going to go through some major changes and you can expect a fair number of changes to be made to these in the next month or so.

****

Falcon Page
~~~~~~ ~~~~

This will contain information and files relevant to the Atari Falcon, currently this page is divided into the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

In here expect to see any news or previews that come my way, whether they be small descriptions or full features with pictures. At the moment there is:

- Pinball Dreams and Llama Zap News.
- Apex News. This contains some information I got on Apex Media for the Falcon when I spoke to Douglas Little on the phone a few weeks back. Not very detailed unfortunately, but I'm waiting on my copy of Apex to give a full review so expect that to be rectified soon.
- Dextrous News. Small description of some of the features of Dextrous with a picture. Only at an early stage of development, if I hear more it will go in here.
- Towers II : Plight of the Stargazer. Pictures and description of this great looking Falcon only sequel to Towers. Expect the demo soon.
~~~~

- Towers II : Plight of the Stargazer Update! The latest news on developments.
U Newsletters from HENSA on Falcon section of archive.

Misc
~~~~

Miscellaneous information on the Falcon, including:

U Falcon Demo FAQ. List of Demos for the Falcon, including some form of
information on each.
- Compatibility list of games with Falcon.
- Compatibility list of applications with Falcon.
- Falcon Specifications and Information compiled by Rod McCall.

New Software
~~~ ~~~~~~~~

The latest Falcon/enhanced software available for download. Major revisions to
be done with updates here. All files now list there size so you can see how large they are
before downloading. At the moment the following software is
included, with more to come:

**Apex Media Demo (Demo version of the animation and art package for the Falcon)
**Towers II (Shareware game)
- Super Bomber Man (freeware)
- Play MPEG v0.70 by M.D.Griffths (shareware)
U Speed of Light v3.8 (shareware picture viewer)
- Scape a planetary landsacpe generator.
- Digital Tracker demo of commercial version.
- Obsession 1 level demo.
U FOG issue 8 diskmagazine for Falcon.

Other software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth using on the Falcon.

- Backward v2.52. For compatibility with the ST. Please send any versions
which are newer than this.
- MultiBlow. Configurable overscan utility.
- Starball. Excellent pinball game (Falcon enhanced).
- Berzerk. Excellent version of Berzerk (Faster on Falcon).
- FOG issue 7 diskmagazine for Falcon.
- FOG issue 6 diskmagazine for Falcon.

****

Atari ST/STE/TT/Mega STE Page
~~~~~ ~~~~~~~~~~~~~~~~~ ~~~~

This will contain information and files relevant to all the above mentioned
Atari formats, currently this page is divided into the following areas:

News
~~~~

In here expect to see any news or previews that come my way, whether they are small descriptions or full features with pictures. At the moment there is:

U Newsletters from HENSA on TOS section of archive.

New Software
~~~ ~~~~~~~~

The latest (most recent versions) software available for download. Major revisions to be done with updates. All files now list there size so you can see how large they are before downloading. At the moment the following software is included, with lots more to come:

U Speed of Light v3.8 (shareware picture viewer).
- ST Zip v2.6. Latest version of ST Zip.
- Obsession demo. 1 level of this great pinball game.

Other Software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth having on the Atari.

- Utopus. Two player shootem' up (STE only).
- Ozone. Good platform/puzzler.
- Starball. Excellent pinball game.
- Berzerk. Excellent version of Berzerk.

****

Lynx Page
~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News
~~~~

News on the Lynx and related material. At the moment there is:

- Lynx Summer Steal Deal Extended to the Fall. News of price reductions for a limited period.

Reviews
~~~~~~~

Reviews for just about every Lynx game ever released will appear in here. All reviews are by Robert Jung. At the moment the following reviews are included:

APB Awesome Golf Baseball Heroes
Batman Returns Basket Brawl Bill and Ted's
BlockOut BattleWheels Blue Lightning
California Games Checkered Flag Chip's Challenge
Crystal Mines II Dino Olympics Dirty Larry:Renegade Cop

Dracula the Undead Double Dragon Desert Strike
Electro Cop European Soccer Chal. Ultimate Chess Chal.
Gauntlet:3rd Encounter Gordo 106 Hard Driven'
Hockey Hydra Ishido : Way of Stones
Jimmy Conners' Tennis Joust Klax
Kungfood Lemmings Lynx Casino
Malibu Bikini Volleyball Ms.Pac-Man
NFL Football Ninja Gaiden
Ninja Gaiden III : The Ancient Shop of Doom

Other Lynx Stuff
~~~~~ ~~~~ ~~~~~

Other items of interest to Lynx owners. At the moment there is the following:

U Lynx FAQ
- Lynx Tips and Tricks

New Software Anouncement
~~~ ~~~~~~~~ ~~~~~~~~~~

Currently empty.

****

Jaguar Page
~~~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page
is divided in to the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

All the latest news and preview information I can find related to the Jaguar.

**ECTS News
**Hyper Image page linked to (Makers of Jaguar game Hover Hunter).
- Jaguar CD Specifications
- Rebellion Development News
- Sinister Developments News
- Sensible Soccer News
U Coming Soon!
- Hand Made Software News

Reviews
~~~~~~~

A collection of reviews from different sources, hopefully I will be contributing
more to this section myself. This page has been re-formatted thanks to
Holger Kipp. Reviews so far include:

Aliens vs Predator - by Eric S.Boltz
Aliens vs Predator - by Robert Jung
Brutal Sports Football - by Randy
~~~~~~~

** Bubsy Bobcat (in
Fractured Furry Tales) - by Robert Jung
Checkered Flag - by Robert Jung
** Cannon Fodder - by Holger Kipp
Cybermorph - by Robert Jung
** Doom - by Robert Jung
Dragon: The Bruce Lee
Story - by ?????
** Iron Soldier - by Robert Jung
** Iron Soldier - by Holger Kipp
Raiden - by Robert Jung
** Syndicate - by Holger Kipp
Tempest 2000 - by Robert Jung
** Theme Park - by Holger Kipp
** Theme Park - by Robert Jung
Trevor McFur in Cresent
Galaxy - Jer Howitz
** Val d'Isere Skiing and
Snowboarding - by Robert Jung
Wolfenstein 3D - by Robert Jung
** Wolfenstein 3D - by ?????

There are many more reviews to come.

Other Jaguar Stuff
~~~~~ ~~~~~~ ~~~~~

Miscellaneous information on the Jaguar. Information included presently is:

U Jaguar FAQ
- Raiden Tips
- Jaguar Game Cheats
- Kasumi Ninja FAQ
- Ultra Vortex FAQ update for Jaguar
**50/60 Hz, games adjusting to resolutions list
**Jaguar Game Cheats
**More Raiden Tips
**Kasumi Ninja Moves List

Other Jaguar Pages
~~~~~ ~~~~~~ ~~~~~

Other pages specific to the Jaguar included in here. Currently there is:

- Atari Jaguar Homepage by Christian Svensson

There are others that will be included, some containing more recent news, but
the one above is the most organised and intuitive one I've came across.

****

8 Bit Atari Page by Ivo van Poorten
~ ~~~ ~~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~~~

Not maintained by me these pages cover the 8 bit formats of Atari machines and are very comprehensive. Nearly everything you could hope to find is contained within these pages.

****

What to expect in the future
~~~~ ~~ ~~~~~~ ~~ ~~~ ~~~~~~

Some structural changes are likely to appear in the next months. I have introduced an announcements page where you can tell the World of anything you have to announce. Please send news of updates to your programs, Atari stuff for sale, and any other Atari announcements here (NOTE : Commercial companies should send information on products to be included in here and in the news sections).

Also coming soon will be a monthly editorial. In this I will try and sum up the month past and to give my opinions on how I saw things for Atari at that time. Hopefully I will be able to look back over many good developments in my pages and summarise them as they happened.

There is an outside possibility of starting a programmers and/or MIDI section in these pages but this is as yet undecided. I will judge whether or not to do this based on the kind of response I have. I do not want to repeat any of the good work done in these fields however by other Web page writers such as Christer Gustavsson (Where is the response for these pages?)

More support is needed for the questions and answers pages, although initially successfull people just stopped posting their questions. Although the odd one is still coming and answers are still forthcoming. Please support this, it is of benefit to anyone who uses it.

The Jaguar section should have a lot more news, pictures and reviews in the future. I have tracked down a fair bit of news and am in contact with a few companies now and hope to get news from them on there products.

Both the ST and Falcon sections should contain much more news in the future, along with more of the best PD/Shareware, and PD/Shareware reviews. I should have several demos hopefully in the near future for games coming out on these formats.

The Lynx section is to continue to get reviews and I will update the news as and when I get it. Sorry about the lack of updates recently, more to come.

Expect more links to Atari related pages in the future. There will be more newsletters, documents, updates to the FAQ's.

Expect further reviews from Andy and Frank, along with myself (watch out for the Apex Media review). Hopefully I can include more screenshots, and do a few program tutorials. Nick Peers of ST Format and Holger Kipp have offered to support these pages with contributions in the future.

Please write with your ideas, critisms, comments, submissions (software, news, reviews, questions, etc), to me and don't forget that I am now the official maintainer of the Atari FTP list originally by Hallvard Tangeraas. All updates to this list should now be sent to
~~~~

me.

Thank you and see you with the updates to these pages next month!

1154. Re: Emulation

Newsgroup: comp.sys.atari.st
Date: 1995-04-21 00:00:00 UTC
From: hutch@ilmen.lanl.gov
Message-ID: <9504211328.AA05813@ilmen.lanl.gov>
Source record: 167214

In a previous article, satty@cix.compulink.co.uk ("Stephen Atty") wrote:

>Intel and MS are working together on a new concept - emulating hardware
>in software. They propose such radical and revolutionary concepts as a
>software modem!

Amazing. Intel and MS both have this uncanny ability to take existing technology, rework it (usually NOT for the better), and announce to the world that they have invented a radical new concept. It is to laugh.

Apple has had a software modem for it's AV Macs (and now PPC Macs) for about two years now. I used to use it but found it buggy and unreliable so went back to a good ol' hardware modem.

But perhaps someone could make a DSP software modem for the Falcon that worked -really- well, though. That would be cool.

> (and it looks ugly, IMO).

How come we can't use the Fractal maping that was used in a 8 bit Lucastgames,
or was the ST range not up to what the 8 bits could do, none of those Great
Lucast games were ported to the Atari ST...???

Atari made a big step backwards when they brought out the ST, they should have
gone for the Mindset Computer that they had the option on...

The Mindset was a king of PC type clone with great graphics...

>> - NO texture mapping on the walls. They use gauraud (sp?) shading
>> instead. (and it looks ugly, IMO).
RS>
RS> How come we can't use the Fractal maping that was used in a 8 bit

Because that would involve some skill and the will to produce something
worth it's salt. This seems to be a very rare quality for developers to
have nowadays. I.E. it's all to do with money - not quality.

RS> Lucastgames, or was the ST range not up to what the 8 bits could do,

No, it's much much simpler than that - nothing available today shows the
true power of any of the machines in question including Mac, PC, Falcon,
Amiga and all the others. It's got a lot more to do with there being a very
small number of programmers / developers with a true flair for their work
and since most developers are on the PC now anyway, they are spread VERY
VERY thin on the other platforms. It's just that 951f what's out there is
rubbish and a spindly few percent of what's left is not a hell of a lot to
go on.

RS> none of those Great Lucast games were ported to the Atari ST...???

I doubt that had anything to do with technical capabilities.

RS> Atari made a big step backwards when they brought out the ST, they

It lasted a very long time and even gave the Amiga a few problems in those
days. I think it's more than inaccurate to suggest the ST was a step back.
It's an ancient relic nowadays compared with the fastest PC's but it was
powerful in it's day and had a very clean and bug-free processor
architecture - a lot cleaner than even today's PC. Developers were not
hindered by fudges and kludges like they are nowadays. I have written (and
helped out with) a lot of stuff on many platforms including Amiga, ST,
Falcon, PC, Jaguar, SNES, Genesis/Megadrive and others and I know what's
involved in each case on a hardware level. I have seen what's required just
to read the joystick on the PC and it is stunning that somebody actually
believed that this was acceptible. It's an utter utter nightmarish calamity
of a design which has done a lot of damage to real progress in the computer
market. It's bad news for us all.

RS> should have gone for the Mindset Computer that they had the option
RS> on...
RS> The Mindset was a king of PC type clone with great graphics...

Making comparisons between the linear architectures of the 68000 associated families and the old Intel approach is not worth the effort, as the former was by far the better choice (especially as Intel are now taking this system more and more on board with each new release). The fact that the PC is widespread has nothing to do with the machine (infact, more in SPITE of it than anything else) but because the market went in that direction due to a great number of factors, not least the most famous and only real household name in computers (IBM) and the fact that it was always marketed as a professional machine and would therefore slowly infiltrate big companies, then smaller offices, and then finally peoples homes - as it undoubtedly has.

It's sad to see people making pointless comparisons between machines that are ALL underused and well out of date - especially when the comparisons themselves are calibrated differently. Maybe someday people will realise that it's not what you have or what gizmo is in it or what it cost that matters, it's what you CAN and WILL do with it. THAT would be cool.

Doug.

IU> problem.
IU> If anyone can help I'll be most grateful as I heard there was a
IU> problem with this but I'm at a loss at how to solve it.

This is weird - we tried the same thing last year and got a certain amount of 'ocrrupted' audio playback but no problems with the host port itself. It may be something we missed but I don't remember coming up with a solution afterwards - we ignored the audio and went ahead with the 3D stuff intending to go back later. This is worth another look at the user manual sometime methinks!

:)

What type of IBM, Ken? I have a WDS3160 which I'm having trouble getting up to steam. Anything particular you had to do to yours? Would previous use of the Stacker make things difficult?

I use Tapebios since I mostly do Image backups, it has worked well.
The author mentions problems with Archive Viper 2150's, but I've never had any.

There is a version of TAR which works specifically with Tapebios.

A problem I have is that Tapebios runs in Super mode, so it's not so good
when using MiNT.

I would like to add the capability to run my MAC programs at home. I have an Atari 1040STE with 4 Meg of RAM. My company is also selling off some older Mac SE computers with 20 Meg HD's for $250. I would like to determine whether it would be better for me to buy one of these, or to buy one of the many used Spectre GCR systems I see advertised. I have not followed GCR for a long time, so I am not sure about its ability to run commercial and shareware mac software. Some of the main programs I would like to be able to run are: Word 5.1a, Excel 4.0, Canvas 3.5, Filemaker Pro 2.1, Quicken 5.0. Can I run America Online software with GCR?

> I am thinking of getting MagiC from my ST...

William, MagiC is quite a bit faster than TOS. It also does preemptive multitasking, so of course there is a huge advantage over TOS 2.06 or other versions. It handles memory allocation far better, too.

It comes with Magxdesk (unless 2.5 is different in the way from 2.0, which is the version I have), which is a serviceable desktop.

I wrote about MagiC for the GEnie Lamp, and that issue will be out in a few weeks. The revierw is quite long.

: I'm looking for a DOS program that will read and write Atari ST DD disks. Does anyone here have
: any suggestions? I'm also looking for a Atari ST utility to read and write DOS disks.

just format the disks using MSDOS, but be sure to use a formatter that gives
the disks unique serial numbers (unlike some PC formatters). I use "Hcopy 1.6"
for formatting. You will be able to use the Atari disks in both your ST and
PC.
For existing Atari disks you can "convert" them to MSDOS disks even without
re-formatting or loosing any data. It only changes the bootsector a bit for
MSDOS. Can't remember the names of those programs (there are several).
Write me back if you don't already have the answer for it, and I'll
check out the files on my disks for it.

Hope this helps.

Eeee..'ecky thump, Rod. This is truly AMAZING!

It takes quite a bit of data fiddling to set up a recognisable partition so
something is doing this INTENTIONALLY.

What s/w are you running when this happens?

The higher the frequencies passed over the SCSI bus the more important
correct termination is likely to be. However, don't be too driven by the
pundits prescriptions. Depending on the cable characteristics and line
drivers you may sometimes find that NO termination is the best solution.

RG> ATM I use a passive terminator on the end of
RG> my SCSI chain which is a collection of fairly old SCSI 1 and SCSI 2
RG> devices.

This terminator belongs to one of the devices, right, not a special affair?
You can always make the SCSI-2 the last in the chain and exploit its active
termination if your geometry allows. Otherwise I'm sure you would be OK
bunging it in the middle of the chain sans termination and relying on the
passive term you already have.

Just to add to the irrelevance

As a general hint do NOT buy Dalepack Beef Steaks (I think thats what they were)

here is a rough quote

"a blend of beef and OTHER meats"

On further investigation, yes the burger did contain beef, but as for
the other meats they were again listed a s just "other meat" in the
ingredients. I am now somewhat concerned as to what was actually in them.

These burgers are not really what I would say as a big 'no no'.

1196. [Q] HELP ME - with a DSP problem.

Newsgroup: comp.sys.atari.st
Date: 1995-04-21 00:00:00 UTC
From: Alan Parker <se2ap@dmu.ac.uk>
Message-ID: <3n80un$n9s@macondo.dmu.ac.uk>
Source record: 167297

Hello,

I have coded some texture mapping using the DSP on the Atari Falcon.

I have tried to add a DSP mod player running on Host Command Interupt
and using the SSI to play the mixed samples.

The problem I'm having is that when the DSP interupts it crashes if
my main routine (non interupt driven) writes to HTX, reading from HTX
doesn't seem to cause any trouble, but I have not checked that
the data recieved is not corrupted.

I am saving all the registers in the DSP mod player and putting them
back. I am using DSP flags 2 and 3 if that might be a problem.

If anyone can help I'll be most grateful as I heard there was a
problem with this but I'm at a loss at how to solve it.

Thanks

Alan.

>Have you tried playing "MidiMaze"?

Yup... MIDIMaze is one of my all time favorite computer games. *NOTHING* can beat having 16 STs hooked up all at once and playing against 15 other human players..!

Atari really blew it by not doing a MIDIMaze for the Lynx system.. it was such a "natural" for the ComLynx.. but someone in charge at the Chicago Atari game center "didn't like" the game, so they never developed it.

I'd expect that any "DOOM-like" game on the ST would look an awful lot like MIDIMaze... there just isn't enough horsepower available to do texture-mapping on the walls, so they'll likely be all one color, and having only 16 colors available will limit the other graphics as well.

But even though the game wouldn't LOOK exactly like DOOM, I think it ought to be possible to create a *similar* game on the ST.. just take Dungeon Master and add a fluid motion to it.. "Dungeon Master 2000"

The "host adapter" needed to run a standard SCSI hard drive mechanism on an Atari ST is a hardware device which converts the "almost standard" Atari ASCI interface of the DMA port to the standard SCSI signals needed by the hard drive.

The ICD Link is a very small device which is a lot easier to use than earlier types of host adapters.

I haven't had any luck finding the part numbers of the suspect DMA chips in early 1040STe computers. The problem only affected the earliest production runs before it was caught, so unless your STe is an early version, it may not be affected.

I have both a mac se and a gcr on an STe, so I'd like to clarify some points in Mark van Wyk's post.

True, the SE runs system 7.x, and the GCR doesn't; so if you need system 7, you'll need a mac.

The only trouble I've had with the GCR is printing, but I'm not through experimenting with the shareware mac printer driver and the dip switches on my dot-matrix printer. I've come close to satisfactory printing with clarisworkss, but the mac program TeachText, which is used for the "readme' files always bombs when I try to print.

With regard to disks 720/800k v 1.44M, many Mac SEs don't have the larger superdrive. YOu'd want an SE/30 for that. In this regard, the GCR with spectre software version 3.0 has an advantage. On a mac, you need the superdrive and apple fileshare to read ms-dos format disks, but with gcr, you can read 720k msdos disks into the mac environment using apple fileshare which typically comes with the system software. I've found this very handy in going back and forth between pc clones, my favorite atari, and the mac which many of my friends and clients use. I frequently transfer files back and forth by this method.

Unfortunately, even if your st has a 1.44 drive, gcr/spectre doesn't support 1.44 msdos/applefileshare. You'd have to split your 1.44M disk into 720k disks on the atare to get it into the mac by this method. Someone may correct me on this: I don't have a 1.44 drive in either machine.

Macs with superdrives don't have this limitation.

As a poor writer and arts administrator, I feel very fortunate with my atari and an se I got at the goodwill store to be able to do most of what I want to do. If I had to give up one, I'd give up the mac se, and if I had my drothers, I'd have both a nicer atari and a nicer mac.

Odd - I read (in this news group IIRC) that 32K was possible. If so al we
need is a little bit of hardware

Steve.

1208. CD-ROM driver help needed!

Newsgroup: comp.sys.atari.st
Date: 1995-04-22 00:00:00 UTC
From: lamarth@delphi.com
Message-ID: <pq0dphL.lamarth@delphi.com>
Source record: 167109

I've got a couple of questions here...

1) I just got a CD-ROM for my Falcon and I'm trying to install METADOS2 to see if the drive is going to work. While AHDI recognizes the drive, METADOS.PRG complains about the drivers in \AUTO\BOOT\ not being installed. CONFIG.SYS is in the AUTO folder, but I don't understand what is supposed to look for CONFIG.SYS and install the drivers- apparently METADOS doesn't.... or does it? Oh and by the way, I did modify CONFIG.SYS so that it will look for SCSI device 0, the CD-ROM.

2) I also got a newer version of AHDI but I can't seem to find the old version of AHDI that's on the drive so I can replace it. I thought that HINSTALL could do the replacement but apparently it doesn't as when I tried to run it with the new AHDI in the same directory as HINSTALL, the system came back up with the old AHDI.

Any help would be appreciated!

David (lamarth@delphi.com)

I've got the original version of MIDIMAZE that Hybrid Arts put out in the ST's infancy. Although not QUITE in the same league as DOOM, one must admit that its playability is incredible for a ten year old game, even today.

: >The Falcon may well be an outdated machine, but thats not because of the
: >hardware. Thats because of lack software support!

I don't quite understand this "lack of software" -claim.. There are
plenty of good programs available for almost any use imaginable. At
least, I feel so. Still, things definitely could get better too.

: >There may well be alot of pleased ST/TT users out there using Magic now, but
: >you just try ask them what they want to do when there is no more new software
: >for their computers. Do you think they're gona upgrade to a Falcon ? No, why
: >should they, there isn't any software for the Falcon either, because stupid
: >software producers/distributers "FORGOT" to support it. This means people
: >are jumping directly from the ST/TT to another platform, insted of upgrading
: >within the same platform when it's available.

Some people are jumping - some will not! I personally think that the
illusion of "no Falcon -software available" is more psychological than
real. It's easy to see the software flood for PC-compatibles. Some people
just want to collect software (illegal copies just for fun), and play
with it. Well, it _is_ fun, I guess..! But one can really get good
software for Falcon, if he wants to:

Calamus S / SL (DTP)
DA's Layout (DTP)
Chagall (image proc.)
DA's Picture (-"-)
Morpher
Apex Media
ImageCopy 3
DA's Vector Pro
X-act Draw
X-act (graphing)
Freeway (database)
Phoenix 3 (-"-)
Twist (-"-)
Papyrus (word proc.)
Script 3
That's Write 4
Gutenberg
Signum! 3.5
Tempus Word

Pure C (programming)
Pure Pascal
Application Construction Set (kind of "Visual Basic for C and Pascal)
HiSoft Basic 2.1 compiler
Devpac 3 & DSP assembler
Cubase Audio (sequencer & hard disk recorder 16-track)
Notator Logic Audio
...
And that was just a tiny sample of Falcon-programs. All very good stuff!

: Along these same lines, it has been my PERSONAL (read- limited) experience
: that those who own higher ended machines (especially the Falcons) are the
: ones who are actually buying products for their computers. I had a second

I agree. No matter what non-Falcon owners think of, we really want new,
good software - and buy it, too!

: the ones who are spending the money. Most Falcon owners
: I know have CD-ROM drives and decent size hard drives, and are on the
: lookout for new products. In contrast, I know many people who have 520 or
: 1040 ST's, and they are collecting dust in a closet somewhere.

The fact that Silmarils publishes at least 2 CD-ROM games for Falcon (!)
tells us a lot. Falcon-owners hunger for quality software!

: The Falcon hardware is definitely capable of competing with other platforms
: for a few years to come (especially with 3rd part add-ons) . . .
: The software, although scarce, is quite good
: actually. I still have reservations about recommending Falcons to my
: friends (who are definitely interested), because they must 'hunt' for
: support. . . but for the right persons, the Falcon is ideal.

You're right. I wouldn't recommend it to anyone, either. But for someone
really interested in computing, willing to experience new things, and not
caring of what those "ten trillion flies" use and think, Falcon is about
the ideal computer. Especially, when its users can form user-groups!!
That makes it pretty easy to get new soft- and hardware. And those groups
can negotiate special prices for group-purchases!

Keep on flyin' high!

TH

: Fact: Pentium and at least the PowerMac 6100/66 will blow away a Falcon using
: any desktop publishing App. And you know what that these systems cost less
: than a Falcon set up. So why tell new users that a Falcon is a better buy?

Maybe because it's a better computer =-) ! I can put a jet engine into
my old car, but it still won't fly. At least very high.. PC is 70's design.
They can tune-up it as they will, but still it is antique with jet engine.
And your Mac: it emulates 68020. Falcon has 68030 with PMMU - and a
much nicer OS (IMO, of course!). And DSP, and Blitter, and MIDI
capabilities with great software... Why is Falcon a better buy? Because
people love to use it. That's reason enough, even if you don't see it
;-) ! It's a very nice computer.

: Are these TT and Falcon's still in production and widely available?

Widely enough for people who know what they want. You can always get an
Eagle, as a fully compatible, improved TT. You can get real power with
Medusa 68060. Using 68060 and GEM I wouldn't care very much about anyone
trying to impress me with some Pentium or PPC/MacOS computers =-) !

: Mac OS is fine whats wrong with your?

No, MacOS isn't "fine" at all. It's easy to learn. But it's tooooooooo
slow (especially when handling DOS disks). It's boring-looking. It's too
stupid after getting used to GEM. And it isn't very stable. after all. I
prefer GEM, even with its own faults. It's my opinion, nothing more,
nothing less. And what did you try to say, anyway ;-). Mine what?

: Good enough is not enough, it has to blow away the others, which it does not..
: You are asking users to invest in a $2000 Falcon setup..

And your PowerMac blows away the others? You know, the science has
proved that people tend to find "reasons for their purchases" after
they've done the purchase. They like to think that "I did the RIGHT thing
selling my ST and buying a Mac..". They like to think they didn't make a
mistake...

: > I've myself seen Calamus SL and Atari TT doing things that left some
: > PC-professionals just staring, and saying: "My 486 couldn't do THAT..".
: > You can tune-up your Falcon to do small miracles, too.
: > Try - it's fun ;-) !

: Like ST users drool over the latest Mac/PC title. We can do that too..

Name just three of us who drool your titles ;-) ! You have some
spectacular programs, true. And we have things like Apex Media Mac
doesn't have. Two worlds, different worlds. No use arguing!

It seems that Troy's discovery is the best solution yet - one reason I need
an auto folder program to set rez is to test Mint-X in Sthi on my TThi
setup - ie there is an auto folder program which emulates all nonTThi
modes in TThi - the problem is is leaves the computer in TT-low - so an
AUTO folder program which runs between the VGA emulator and Mint is what
I need - Thanks Troy, I'll give it a try!

Just becaue I'm obsessed with lists, there's no need for any slagging.
Anyway fallowing on the success :) of my other two lists here goes....

If you own a Falcon and would like to get in touch with other users
please subscibe to the following.. I am not including addresses,
or telephone numbers at this stage,

Just complete the details outlined below and email them to me:
in the subject field of the message please include "FOL: "

==========
Name:

email address:

Mainly used for: (e.g Wordprocessing, music, games etc)

==========

: >>Er... not that it really matters in the long run but considering how many
: >>more ST/STe/TT machines are in existance compared to Falcons, why do you
: >>think this was a stupid idea? I would have done likewise.
: >
: >Perhaps you would, if you're going to base you company on old machines.

: No, I would be basing my company on the goal of trying to make a profit.
: Once some cash flow was enabled, -then- I would try to expand my software
: to make it compatible with machines that have a lower installed user base,
: such as the Falcon.

The idea itself doesn't sound bad. In fact, most U.S. software houses
have acted just like that when abandoning Atari- and Amiga platforms.
They have taken the A&A programmers out of their 68000 projects, and put
them to make PC software instead in order to make more profit.

This just doesn't work; it's a one-way road. Once you start thinking of
profit only, you'll never go back to your "roots", to make software for
platforms that don't make as much profit. If we think that "making
profit" is the RIGHT way to do business, then it's o.k. that PC rules, and
most games makers just ignore the minority computers.

I doubt that many people here want to read philosophical thoughts ;-)
-but anyway, we *should* think about this for a minute IMHO. If we really
let the market decide everything, what'll we get? The result from profit
-orientered business thinking is this: no alternatives anywhere. No
Ataris. No different television programs. No different newspapers. Only
something that makes the faceless "majority" satisfied, but doesn't make
almost anyone really happy.

I feel that we, Atari- and Amiga-users are mostly people who do _NOT_
want to have a gray, uniform society where profits dictate what we can
buy and what not. I know that many business-people wouldn't give a sh*t
for these thoughts, but I don't respect them any better. I think that
firms must make enough profit to survive - but, above all, they must be
able to satisfy all kinds of needs. Also minority needs. We'll get a
very nasty world to live in, if money decides everything alone...

So, it's very important (I think) to support Falcon, even when it's not
economically profitable. Falcon represents today, ST yesterday. We can't
live in yesterday.. Eagle and Medusa may represent future for us, if we
take them seriously - and they know what they're doing. This very clearly

is a fight for life, now. If people get tired of what Atari represents
(the WAY of computing it represents!), and move to other platforms, then
computing world will be a grayer place tomorrow. We have to fight against
that, or buy PCs. Who wants to do _that_ ? Macs won't get most of us
much happier, I'm afraid. Some, but not all. So, this is war!

: This is all academic, anyway. Companies will frequently do something that
: the user doesn't like or does not understand but there is often a very
: good reason for it and usually it's profit based. That's business, ya know?

We know. Too well, Hutch... But the question should be: do we *want* it ?

If "business" forces us to buy bullshit, it's time to say "no" !

If I have to use a PC to get some job, I'll do it. But at home I will use
whatever I _want to_ use. And that's Falcon. That's our own choice,
whatever the business-brains try to decide =-) !

Hutch (hutch@ilmen.lanl.gov) wrote:
: In a previous article, gs01tph@panther.Gsu.EDU (Tommi Pekka Hietavuo) wrote:

: > Is every Atari owner an idiot when using Mac and PM? Or am I the
: > only idiot among (otherwise very Mac-honoring) Atari users..??

: Of _course_ not. Don't be facetious. All I'm saying is that PageMaker
: (along with the equally capable Quark XPress) are the primary page layout
: tools used by the thousands of commercial graphics service bureaus,
: desktop publishing houses and independent artists on their Macs in the
: US (don't know about other countries). They do this work for a living and
: evidently do NOT experience the difficulties you refer to. So why not?

Professional software isn't bugless at all. At my previous job, the
graphical gang knew pretty many ways to lock Corel Draw up. They just
tried to avoid certain actions that would activate the problems. But if
those professionals don't get the same problems with PostScript and PM as
I had, there may be many other reasons. They might use a different
printer, different display resolution... and different fonts. I suspect
that PM didn't like this font I used - because sometimes it stopped the
whole printing process with message "Postscript fond download problem",
or something like that. You just never knew, when.. Another try often
succeeded. The result just wasn't good even then (bad kerning).

: > If I was the "stupid Atarian who hates Macs", can you please tell me,
: > what it was I did "wrong" ?

: Ouch! Those are YOUR words, not mine, mate. Thank goodness, too. But in
: regards to your specific WYSIWYG problem, you did not mention one very
: key piece of information... what kind of monitor and what resolution were
: you using PageMaker with? With the wrong resolution, you'll NEVER get
: WYSIWYG. Just as a guess, try changing to 832x624, if possible with that
: monitor, and try printing again. You might also check to make sure that
: you are using the proper PPD file for the printer. This is all SETUP stuff,
: BTW, that should only have to be configured once (if done right).

Sorry for overheated words - but sometimes you just get tired of
some very common attitudes many people have towards Macs, Ataris, PCs and
their users... What comes to my "problem", the set-up was following:
Mac Quadra 700, Apple 16" 832x624 monitor, 256 color mode, printer was
Apple LaserWriter II. The set-up worked fine with other programs.

I feel the weakest point of Macintosh is the PostScript printing. It
works well, when things go as they should - but it just doesn't create
complete WYSIWYG environment. The only way to make certain that the
display and the printout match exactly, is to use the same rasterizer for

both display and printing. This is what Calamus does. It's quite possible to use bad-quality fonts in Calamus, too - and get problems with kerning. But this is the difference: using Calamus, you'll see immediately from your screen that the kerning isn't right. And after you correct it manually, you know that your work will look correct when printed out.

This is productivity, is anything, I think: you don't need to make many prints - because what you see is what you'll get. Calamus isn't perfect (sometimes e.g. a bit confusing to use), but when I need to do something fast and well (no time for errors), I can't think of a better tool.

: Again, PageMaker ain't Calamus SL... but it's still very capable.

I agree =-) !

Hutch (hutch@ilmen.lanl.gov) wrote:
: In a previous article, gs01tph@panther.Gsu.EDU (Tommi Pekka Hietavuo) wrote:

: >My Falcon runs Calamus SL as fast as any 486 PC runs PM or Ventura - or
: >a 68040 Mac runs whatever publishing software.

: Wow! That's a pretty strong claim there, Tommi. Would you be willing to
: submit to some kind of comparison testing? I don't own Calamus SL any
: longer and honestly I just don't remember it being quite THAT fast.

It is a pretty strong claim, I know. But not complete bullshit, though.
We both know that it's impossible to measure the speeds reliably. Calamus
may be faster than PM or Ventura when loading pictures. PM may be quicker
text-formatter. And so on. What I mean, is the _subjective_ speed of
software: how fast or slow if _feels_ when you're working.
Newest Calamus SL versions are very fast, considering what they do.
Especially considering that they use kind of "display postscript"
rasterizer in order to create best possible WYSIWYG. What SL versions
have you used? Older are pretty slow.

Calamus is very fast (on a Falcon, TT, or a faster machine) when
importing big color pictures, printing, or moving objects from one place
to another. Its text-formatting is rather slow. This is no big wonder
because of the way Calamus handles text, anyway. I would say that Calamus
on a Falcon is very fast and effective tool, when you're doing free
design work (like Ads) with lots of pictures and graphics, but relatively
little text. Ventura is superior (IMHO) to Calamus (talking about speed,
at least) when you have to handle great amounts of formatted text.

: Hey, If the Falcon's 16MHz 030 can outrace a 486-100DX4 PC or a 40MHz
: 68040 Mac in identical dtp tasks, then that really IS saying something.

If they all used a similar OS, I wouldn't say anything that stupid =-) !
But as they don't, I just might. MacOS is terribly slow compared to TOS -
and the machine *subjectively* feels sluggish even when using 68040.
Windows is world-known for its slowness, too. But these are facts that
many people just won't admit easily, or at all. Anybody using MagiCMac
should know what I mean... MagiC is FAST. TOS 4.04 using NVDI is fast,
too. With a fast OS, you really don't need that much hardware! 030-16 is
then quite enough for many tasks, if not for all.

: And if Calamus SL on a Falcon030 is that good, the world should know!

It's good enough to do the job. What else do you want 8-) ?

I've myself seen Calamus SL and Atari TT doing things that left some
PC-professionals just staring, and saying: "My 486 couldn't do THAT..".

You can tune-up your Falcon to do small miracles, too.
Try - it's fun ;-) !

Hooking up SCSI drives to your Falcon is a snap. You need one SCSI-SCSI II
cable and AHDI (the Atari HD utils that come with the Falcon)
MAke sure the SCSI ID is set appropriately and reboot the Falcon.
You should see both an IDE and SCSI drive recognition message when you reboot.

If you want to add more SCSI device to your Falcon (more drives or CD-ROMs)
just make sure you set the IDs properly and everything should work without
problems. I just bought a second 520 MB SCSI to complement the 120 MB one
and the internal 84 IDE. Everything works like a charm (except I'm running
out of drive letters :)

Full marks to that man......

Atari (even Amiga) are seen to be inferior to PC purely because of sales. When you compare a PC you should be comparing hardware, if you want to compare software then bring in the Windows crap (which I have to use everyday in my business) and starting comparing to full systems as Magic!, Ease, and other desktops/multitasking systems. The facts are that the basic PC architecture has'nt drastically changed for the last 10 years. Where the PC wins is it's ability to be upgraded with cheap quality parts such as decent video cards etc and the wealth of half way decent software such as (prepares for flames from Papyrus Gold users) Word 6 (even if it is over written in terms of HD space)

I think a clear proof of the ST architecture was that a 1040 STFM could emulate 286/386 PC through Vortex/PCSpeed and could have the same benchmarks as a 386 SX16 in mono VGA, not bad for a 8Mhz machine, and this was cheaper than the equivalent 386 was at the time. You need a half way decent 486 to emulate a ST, and a bloody powerful DX4 to beat the ST's speed. It is a shame that an ST was never developed that could take advantage of some the available PC upgrades such as video/(relatively cheap then) HD and other upgrades, I don't think this would have been an insurmountable technical problem.

Most companies use PC because they set a (debatable!) standard, not because they had brilliant operating systems.

But back to topic (sorry for ramblings, us old Atari users are known for this ;-)) the Falcon is a very nice machine even with it's faults (I mean whose great idea was it to limit memory and video!! arghhh) but desperately needs a faster processor, I still very much prefer my TT (even though I have both). I just wish that the processor accelerators would come out now.

The publics 'love' of PC's really boils down to a few simple things, their the standard, they're everywhere and their cheap. In the case of the latter my nextdoor neighbour for a Pentium 8mb RAM (I think), SVGA, sound card, CD ROM and 540 md HD and LOADS of software for around 1500 ukp.

Atari simply could NOT compete, purely because they are non-standard and do not enjoy the same economies of scale. Its a shame but also a fact.

I hope that C-Lab make a go of things, because otherwise people like me who want to develop Falcon software, will have no market to sell it to. Hence, we wont!!

1231. Mega STE for SALE!!!

Newsgroup: comp.sys.atari.st
Date: 1995-04-22 00:00:00 UTC
From: dogman@svpal.svpal.org
Message-ID: <3nbcko$anq@borg.svpal.org>
Source record: 167132

I have the following Atari Computer for Sale:

Hardware:

Atari Mega STE 4
4 MB RAM
50 MB internal hard drive
Magnavox ICM135 14" Stereo Color Monitor
External DS(720K) Floppy Drive
Supra 2400 Baud external Modem
Beetle Mouse
Atari standard Mouse
Wico Joystick
3 2600 Joysticks

Software:

Pagestream
WordWriter
Word Flair II with FSM GDOS
Diamond Back II
various other utilities (Warp 9, look it, etc...)
plus MANY GAMES (Dungeon Master, Empire, Uninvited, etc...)

****
Everything is in MINT condition, and I have the original
manuals for the software/hardware, as well as the orginial
boxes for the hardware.

Shipping can be arranged. I would prefer US sales, payment
must be in US funds.

I am asking $700 or best offer for the whole package. Please
send me EMAIL at dogman@svpal.org if interested of if you have
an offer.

You do not believe that, do you? That would mean the processor got faster by using MM. I wonder if you use your TTs with a software slow-down or something like that. In fact - what you are writing there insults our intellect.

>upgrade boards? Thanks.

Try to get the Chip manufacturer Data book. Actually any DRAM databook will do
cause there is a standard pinout.

When you use a memory upgrade board, the onboard DRAM are just there to warm
things up, especially useful in winter, no? The upgrade board RAM replaces all
the motherboard RAM.

Source record: 167135

AF>> programs are not fast-loaded, and which ones get a different kind of
AF>> fast loading -- how much memory is cleared.

By default it clears a certain amount of memory (32k?) for each program,
which overcomes a lot of problems that programs have with the fastload
bit. You can also fastload all ACCs, unlike the fastload bit.

AF>> One handy use of Pinhead is to make sure that the last program in
AF>> the auto folder and the first desk accessory are loaded without the
AF>> FL option. You do this by specifying those filenames in the
AF>> PINHEAD.DAT file.

Why is that handy? Why would I want to do that?

> others down?
>

Its obvious really - there are an enormous number of insecure sad bastards who can only justify themselves and their actions by running what everybody else does into the ground. It is found everywhere - its just that the computer based ones are even more inane and the main problem is that these people having alienated everybody in their street/youth club/school/town etc, have now latched onto the internet as the latest "in thing" and instead of pissing off 10 people can piss off 10,000 for the same amount of effort.

I have only one thing to say to PC/Mac/Amiga/Nintendo/3DO owners everywhere - my DECserver 2100 pisses on you all :-,

See a previous message about my amazing PC free Multi-media system.

Now lets get this newsgroup back on tack and discuss what we all want to - Atari computers :-)

Gosh I needed that! Time for a coffee and some choccie cookies

It was none other than -Unknown- who did write on 13 Apr 95 that ....
-> From: Richard Grable <richie@wolfe.net>
-> Organization: Wolfe Internet Access, L.L.C.
->
-> The ICD Pro utilities will work fine. Just sold my Falcon that had
-> 4 external drives with 3 SCSI addresses attached. You will, however,
-> find that they are slower with the Falcon than other Atari's.

You must either of had a very old drive or it was not set up properly becuse I get Access/transfer speeds on the Falcon that would not have been possible on any other Atari ?? Of course I had to replace the older SCSI1 drives to take advantage of the Falcons better SCSI capabilities but I certainly did never loose any speed.

I think perhaps there was a bug in a version of RATEHD.PRG which gave you this misinformation ?? , IIRC this was the case in an older version ?

Use HOW_FAST.APP ...it is much more comprehensive and more accurate aswell IM0. RATEHD gives one reading <?> HOW FAST will display a graph based on data blocks and other adjustable parameters AND will take into consideration Caches (Such as TCache63) and therefore is a real help to optimise Cache settings.

It was none other than Michael Olin who did write on 14 Apr 95 that ....
MO> I use Warp9 on my Falcon, and have considered the possibility of
MO> using NVDI instead. But I'm also interested in the _OTHER_ things
MO> Warp9 does for me:
MO> 1) mouse acceleration

silkmouse does it better

MO> 2) screen blanking

blowup (If you have it) does it better . shuts down the Video completely thus
giving boosts to processor power ...great for running POV compiles <G>.
Otherwise this feature is also part of Silkmouse program.(above)

MO> 3) PinHead

use pinheaad then ..or just flag the programs to Fastload using one of the many
little prg's or my choice the CPX ,to do it.

MO> Can you please comment on these three items? Thanx!

I thing the Benefits of a Superb SPGDOS system as with NVDI3.xx ,the extra TOS
fixes (VT codes) and more compatibility with Falcon resolutions
make up for the IMHO slightly cosmetic benefits of Warp9.

It was none other than Brian J. Roland who did write on 19 Apr 95 that ....
BJR> origional disks and all origional documentation. Only asking for the
BJR> complete CS Fonts that shipped with version 2.1. Also...I would
BJR> appreciate any information about upgrading to Version 2.2. How much
BJR> is it? What does it add or fix? Finaly, is there an ftp site that

It is available as a Free patch program ,run it and it converts the program and also includes some improved and additional drivers and import modules ,not least a much improved postscript one. (The drivers and Modules are of course upgradable without patching the program itself)

There are 2 versions of the Patcher program (At least ..was there other language verions ?) , one for the UK version and one for the US one , neither work with the orginal of the other nationality. File name to look for is PGS_22B.ZIP or similar. No idea on FTP sites ,sorry.

Improvements are in speed and some improvement to the notoriously bad screen updating and quality of font display . It is still a tad sluggish but much improved. It is also generally more stable and certainly less prone to crashing during print runs.

Linux68k, of course, but you need a PMMU (>= 68030).

ML>-Where can i get this minit.ttp that everyone is talking about?

Get the Minix filesystem archive (mfs*), it contains everything you
need (XFS driver, minit, fsck etc.) Remember that this archive
doesn't contain the manuals, you also need the source code archive.

I may com off as a total moron here, but I can't seem to get EDPOV to display
any objects. (I got it of cnam.fr). The archive contained no documentation,
so if there are any tricks to it, could someone please let me know?

1253. Info needed : Xtra RAM Simm Board

Newsgroup: comp.sys.atari.st
Date: 1995-04-22 00:00:00 UTC
From: limchung@iscs.nus.sg
Message-ID: <3natj7$6nl@nuscc.nus.sg>
Source record: 167189

Hi,
I'll like to upgrade my 1040ST's memory to 4mb. Is it easy to upgrade using the Xtra RAM Simm Board? Will I need to do any kind of soldering ('cos I'll really lousy at it) ? And what type of RAM chips must I use, such as how many pins, how many ns? Lastly, why is the board so expensive (Toad Computers listed it at $79) ?

Thanks.

Chung Yong
National University of Singapore

1254. Re: Falcon Games List

I've written TETRHEX (shareware). It needs a 68030 (or 68040) and a graphic resolution 256 colors, >= 640*480 (like on a Falcon). A demo version is available on a.a.u.e and on ftp.cnam.fr. I'll upload a new version late in May.

For other shareware/freeware games, look at a.a.u.e (or ftp.cnam.fr).

Vincent Lefevre.

SBM : a (not yet finished) freeware clone of Super Bomberman. Available
on ftp.cnam.fr and should be on ftp.uni-kl.de

ftp.cnam.fr : /pub/Atari/Falcon/Games
ftp.uni-kl.de : /pub/atari/incoming (should be)

MB.

True, that would be possible, but then we would have to care for 3
programs - lots of work again. But, there are good news: A guy in Germany
implemented the Falcon sound xbois routines for the TT and STE (I don't
know if for the ST..), too. So programs playing sounds on the falcon
will work on other machines, too.

Unfortuntely fortune does not yet work, because we stop the program if
it doesn't run on a falcon. But that should be corrected soon.

Laurent Chemla made a Linux Package. I think it's available in
FTP:ftp.cnam.fr or something like that. Anyway, Laurent Chemla
can be reached by mail at

laurent@brasil.frmug.fr.net
or
chemla@cnam.cnam.fr

Hope this helps...

Marc.

: the Atari in any way to-day...
: If PC machines are that bad why do they sell so well, and why have most other
: platforms have droped by the way side, Facts can't lie....

You _really_ should get yourself a Pentium - and change the group from
Atari to PC or Mac! You don't seem to feel yourself comfortable having
to deal with people who not only think that Atari is as good as any PC or
Mac, or their operating systems - but actually think it's better.

If you (with a serious face) can claim that PC/Mac operating systems are
that good (slow as hell, if not anything more!), why do you use Atari
anyway? And why do you try to convert people here from Atari to other
systems? We get enough bullshit on Jaguar area, where it seems like 50%
of messages are written by 3DO/Sega/Nintendo/whatever -owners who only
tell people: Jag is dead! Jag is crap! Ultra-64 chops Jag to pieces...
And so on. Some people apparently love to bring the others down?

Secondly, what kind of computer knowledge is needed to bash Atari and
defend PCs (or Macs) ? Why is it so hard to see that some people just
don't care a bull's shit about Pentiums (struggling with inferior OS'),
or even Power PCs. If a computer is good, and does its job, what do you
want more? Only fools run behind technological innovations, trying to
always use the newest hardware - no matter, if they actually enjoy using
them, or know how to use it.

Oh, I've seen (we all have) the KICKS some people get out of their brand
new Ferrari-PowerMacs, or Pentiums. They ride on the top of the world!
But so what? I get more kicks when processing 16-bit sound with my
Falcon and its DSP. And when using GEM, anyway.

And finally, why do people buy PCs instead of Ataris?

Why did millions of people follow Hitler and Stalin?

Why do billions of people eat at McDonald's..?

Maybe ten trillion flies *can* be wrong, and shit isn't good ;-) ?

Cheers,
TH

Sounds a lot like you have the dodgy version of ls that I was using until
a few months ago. Try v3.9 of the fileutils from the /Mint/Utils
directory of a.a.u.e.

ATB,

Martin

Fact: Pentium and at least the PowerMac 6100/66 will blow away a Falcon using any desktop publishing App. And you know what that these systems cost less than a Falcon set up. So why tell new users that a Falcon is a better buy?

> Calamus is very fast (on a Falcon, TT, or a faster machine) when

I have a urgent need to sell a lot of computer equipment. The first list
of things for sale is the Atari stuff. Below is a listing of the current Atari
equipment that I have. I would like to see an offer made on everything as a
whole. No reasonable offer refused - But then again, what is reasonable.
If you have any questions, please phone 703-256-0927, and ask for andrew.

P.S. Sorry about the Control M's

Thanx
Petra...

What nonsense.

>I can not find any reliable excuse for not doing it like this, unless
>Heidleberg/2B simply don't want the Falcon to be supported, which is what
>i'm reading between the lines.

It's a sound economic decision as far as I can see. Let's say that
writing an OS for the Falcon is twice as hard as writing one for the
ST and TT. Now there are at least ten times the number of ST/TT owners
than there are Falcon owners (maybe more), so the decision to shift
product for the larger platform with (maybe) half the development time
is a basic one.

I'd say we're (ie Falcon owners) are lucky to be getting one at all,
especially if they're writing it to actually *use* the DSP rather than
just catering for its calls..

>I'll get my PC one of these days. From this i'll just let things happen the
>way they arrive.. I'm getting sick and tired of all this shit with Atari
>software, trying to convince people about the need of software support.
>The Falcon may well be an outdated machine, but thats not because of the
>hardware. Thats because of lack software support!

The Falcon is, in many senses, an outdated machine. It's very slow
(compared with a PC or Mac) for *most* tasks. However, it's still a
good machine and you can pick one up for much less than a PC or a Mac
(especially second hand).

I'm afraid that it's time to face up to the reality that we're now in
an almost totally enthusiast market - with the slight twist that we
may see a number of new users either without the funds or hesitant to
buy a new PC or Mac. A second-hand ST is, after all, a very attractive
buy right now for a user who just wants to do a little WP stuff.

That's maybe important to 1% of the user base. You're undoubtably in
that 1% but most (that's everyone, not just people on-line) of us
aren't. Maybe rather than coming out with such a sweeping
generalisation as 'crap' you should say that it doesn't suit you.

>Do you REALLY think that Atari software developers 'forgot' to support
>the Falcon? Are you SERIOUS about this statement? Truly? Really?

Yep, i really do believe they have "forgot" it. If there isn't a market
for Falcon software, then give me one good reason for saying there is
a market for ST/TT software ?

>
>Look, I don't know the Applications Systems gang (the MagiC developers)
>at all, but I can well imagine that they did -not- enter into business
>with the intention of losing money or, amazingly enough, specifically
>to antagonize Kim Anderson and other Falcon owners (such as myself).

They didn't have to. Infact i would say i "hit the bullseye" if i could
code a new OS for the atari platform supporting all the machines.

>
>If their software does not currently support the Falcon, you can bet
>it is NOT because they 'forgot' about the Falcon's existence. There

>a little more every day so it's important to get a _solid_ product to
>market as soon as possible. Like they say, time is money.

I do understand if there may have been problems with Magic on the Falcon.
What i don't understand is why they didn't start with the Falcon. They
would have had an easy job making an ST/TT version after that.

I do understand busniess, but that doesn't mean i have to accept it as
well.

>
>It is unfortunate that Systems Applications does not have your vast
>years of business and marketing experience to rely on, otherwise they
>might not have 'forgotten' about the Falcon. Yeh, right. ;-)

They don't have to have my experiences. But as i see myself as a low-end
user, it might be a good idea if they listen once in a while, as it's
people like me who is/was going to support their products.
But i guess you don't understand much of this either, so i would not bother

to explain that all over to you.

>
>Do we need more Falcon-specific software? You betcha. No argument there.
>Can a software company make a decent profit developing and marketing a
>Falcon-specific software item? Maybe, but it's definitely risky business
>and getting worse every day.

Worse on the Falcon market ? I doubt that. But it surely gets worse on the
ST market. And it's not Falcons they buy. Where does this put a company
like Heidleberg ?

>
>> I'll get my PC one of these days.
>
>I wish you would quit threatening us and just DO IT!

TT>The Eagle has already made it's appearance and a DSP card is due for
TT>it soon so that it will be able to run Falcon specific software.

Hi Tom,

I'm sorry the Eagle won't be compatible with Falcon's Video System. GE-Soft is developing a DSP Card, but this card also is not compatible with the Falcon's DSP system. Software developer will have to modify their Falcon DSP Soft to run it on Eagle.
There is the possibility that a company in Hamburg will develope a Falcon compatible DSP card for the Eagle, but this development won't be easy because the Falcon's architecture is a little bit crazy ;-(

bye, Volker

From: komb1@nudge.io.org
Message-ID: <3ne56v$kif@ionews.io.org>
Source record: 167052

This looks like the right place to ask :-)

I'm attempting to get Linux installed on my TT. I have the bootstrap & Ramdisk working. I have formated & setup a partition on my internal HD.

So far so good. The problem is... I can't seem to figure out the "mount" comand. It gives 2 different help messages. (I should have written them down sorry).

I'm trying to mount "sda2". I've tried as the first help mesage indicates (and as passingly mentioned in a tip file) "mount /dev/sda2 on /mnt". This results in the second and to me indeciferable help message, and a tmap~ file preventing further attempts without removal of said file.

Other than that...It's working fine.

From: smoore@chowgar.demon.co.uk
Message-ID: <798663822snz@chowgar.demon.co.uk>
Source record: 167053

Has anybody got an RGB and a VGA monitor hooked up to their Falcon ?

If so how does one go about getting a switchbox for the two monitors as when I used to unplug my mono monitor on my ST so I could have a quick play on a game I ended up knackering the port and I don't really want to have to do this on the Falcon.

Any ideas ?

Rod, why are you trying to reinvent the wheel? There's a very
well-advanced organisation that holds these details and more called the
Falcon FacTT File.

If you want to know more, contact kbeardsworth@cix.compulink.co.uk or
colinfm@cix.compulink.co.uk or find a UK BBS that's in the NeST network
and join the group N.FALCON.FACTT_FILE

For Sale

Falcon/030 System
4meg RAM/85meg Hard Drive

Extras

HardWare

SCSI CD-ROM
NEC MultiSync monitor(will work with VGA and RGB signals)
65meg 2.5" IDE (If put in a tower two IDEs can be hooked up)
RAMGizmo (allows SIMMS to get a max of 16megs RAM)
BlowUP030 Hard I w/ JoyPad (get Rezs upto 1280x1024)
custom RGB/VGA/Video switchbox
Wico Metal Joystick
Falcon/030 VGA Adapter

Software

ICD Pro Utils v6.5.5 (Hard Drive utils)
Atari Works v1.207 (Falcon/030 comes with 1.2)
STalker v3.04
CoNnect v2.46
GEMView v3.12
Speedo v4.2
Speedo v5.0
Misc Speedo Fonts
Jpeg View (fast DSP viewer, uses RGB ,GIF, Jpeg, Targa, etc)
MIDI software (various ones, lost a couple manuals)
Misc games
Misc non-registered software
Misc Mods, Pictures, etc.

All Manuals and boxes, etc are present. The above are items that did NOT
originally come with the Falcon/030. If you want to know what came with it,
let me know and I will let you know. Same with Specs.

Its not.

Linux/68 running on an Atari requires a 68030 *and* FPU (68881/68882). The only Atari which matches this spec out of the box is a TT. The Falcon with the addition of an FPU chip should work as well.

To get Linux running on a ST would require a PAK3 card or similar. Probably not worth the trouble. You might as well spend the money on a PC and run Linux/pc. You'd have much better support - and decent enough video to run X11R6.

:-(

Roland.

This is the sort of advice I give people when they ask ;-) However I really only know about SCSI 1 - and have a lot of success (and a little failure) with totally 'incorrect' termination schemes. What really triggered the question though was the cost of an active terminator. I've only seen one company advertise one - and it was 25ukp ex VAT. I just wanted to know if other people were using them.

> RG> ATM I use a passive terminator on the end of
>
> This terminator belongs to one of the devices, right, not a special

Well I have several terminators. One is in the CD-ROM (NEC CDR-37) unit I use. However if this is disconected (like when its being used by the PC), I use a DEC termination 'plug'. This just connects into the end of the SCSI chain - like a SCSI device.

> affair? You can always make the SCSI-2 the last in the chain and
> exploit its active termination if your geometry allows. Otherwise

So the SCSI2 will have its own active termination?

> I'm sure you would be OK bunging it in the middle of the chain sans
> termination and relying on the passive term you already have.

I've thought about this as well.

Actually I suppose the real question is - just what *is* active termination - and how on earth do I tell it from the passive sort? ;-)

Thanks

:-)

Roland,

@CiX

Yes!

You can order a set of 7 diskettes from TAF's Library which installs
a MINT / X-Windows / PPP / Chimera / FTP / Telnet. All these PD
systems were written by various Atari People (who we thanks).

Sam Mesbah, put them all together and created an installation procedure.
(It's my understand he will be putting this at an FTP site also! Either
Sam or I will let you know where).

Here is how to order it from the TAF library:
Send $25 Cdn Dollars to:
Toronto Atari Federation
5334 Yonge St, Suite 1527
Willowdale, ON, Canada
M2N 6M2

I will add more information on the TAF home page later this week:
http://www.io.org/~schrist/taf.html

Here are some important notes!!

Requirements:
(0) 14.4 Modem (Min) (Highly recommended) - Appropriate Modem RTS/CTS patch
(1) 4M Machine (Min)
(2) 10M (Min) separate Hard Disk Partion
(3) An Internet Service Provider with PPP - SLIP acceptable but untested.
(4) Mono Graphics mode (ST High, Falcon, TT High)
(5) ST-ZIP, TOS/GEM based text-editor (knowledge of a UNIX, VI editor will make
your life easier but is not essential)
(6) A Boot manager makes your life easier (SuberBoot, XBoot, etc.)

Stephen Christian (schrist@io.org) _ Member of: TAF, DWIN

> ;-) ! It's a very nice computer.

BZZZT. First off, the PC first came out in 1981. Second, I could say that the Falcon is 80's technology. Third, the PowerMac has hundreds of native apps that will leave the Falcon at the starting gate. Fourth, the Falcon's installed base is less than the Jag, so how can you say that people love it. Fifth, the PC and PowerMacs undercut the Falcon in price/performance and software.

For Sale!! Atari ST hardware, books,and software

I am selling the ST stuff listed below. I am willing to sell it as a
'job lot' for 400. However I will consider splitting if the offer is
good enough. I have put a price next to some items as a sort of
reserved price.

Offers etc by email to: mark@markus0.demon.co.uk
or by phone : 01482 791506.

Hardware:
Data Pulse Plus - 127MB hard drive(maxtor) with ICD ST adapter and
s/ware. 150.00 ono.

Books:
The Atari Compendium, by Scott Sanders.
ST disk drives: inside & out, Abacus.
Computes Technical Reference Guides (3 volumes, covers TOS, AES & VDI)
Program design techniques for the Atari ST, by Paul Overaa.
First Steps in 68000 assembly Language, Glentop.
The Concise Atari ST 68000 Programmer's Reference Guide, Glentop.
The ST Assembly Language Workshop, Kuma.
The Atari ST explored, Kuma.
Introducing Atari ST Machine Code, zzSoft.
The Game Makers Manual (STOS), by Stephen Hill.
Real Time 3D Graphics for the Atari ST, by Andrew Tyler.

Offers please

Software:
Lattice C 5.5 30 ono
Devpac 2
Power Basic
Hisoft C interpreter
Wercs
STOS Basic
MultiTOS 20 ono
UIS III
Hyperdraw
Home Accounts
3D Calc (speadsheet)
Master Cad
1st Word Plus
Timeworks Publisher 2 20 ono
Calligrapher Lite

Programming Utilities (includes Knife ST)
Superbase Personal

Games:
Magnetic Scrolls Collection (Fish, Corruption, Guild of Thieves)
Castle Master
War in Middle Earth
Jumping Jack Son
Colossus Chess X
Trivial Pursuit
Street Fighter II
Lure of the Temptress 15 ono
Fantastic Worlds (Megolomania, Populous, Pirates, Realms & Wonderland)
Frontier Elite II. 15 ono
Railroad Tycoon 15 ono
Civilisation 15 ono
Microprose Golf 15 ono
Microprose F1 Grand Prix 15 ono
Sensible Soccer
Pushover
Graham Gooch World Class Cricket
3D Construction Kit
Jimmy White's Whirlwind Snooker
Fire and Ice
Lemmings 2

Hi,

The friendly Atari robot at atari.archive.umich.edu posted this
recently:

>-rw-r--r-- baldrick 724961 Apr 11 19:57 ./Games/Space/zero_5.zip

So I thought, what the heck only 724961 bytes let's give the ole modem
a good test :)

Was I surprised when I loaded this demo game onto my MSTE. Superb
sound and some of the best animation sequences I have yet seen for the
STE. An atmospheric intro is followed by a basic menu where you can
choose to view various spacecraft in an Elite style presentation or
play a demo mission. Try both. The flight controls are incredibly
smooth although finding something to shoot at requires good 3D
navigation.

There are three phases to the demo mission. First a space battle where
you must turn all the Morphon spacecraft into brilliant orange
explosions, then a battle just above the surface of an asteroid
(reminiscent of Star Glider) where you have to so the same to another
bunch of persistent Morphons, and finally another space battle where
you do it all over again. Then you can go home and watch the docking
sequence (a la Frontier).

Excellent graphics, great sound and controls.

Unfortunately there is no automatic demo, documentation or email
address so I don't know what more I get after paying the 25 pounds
sterling for the full version. I'm tempted.

Is the STE wizard Andrew Gisby or anyone from Caspian Software around
to tell us more ?

Ian_Taylor@a2w.maus.de The hidden secret of life is

S > have seen of DOS 6.xx and Windows it leaves Ataries OS for
S > dead, even John Townsend stated that. I can't even believe
S > any one with some kind of computer knowledge can defend the
S > Atari in any way to-day...

Seeing as this is coming from Roger Sheppard, the "computer expert" (NOT!) whose vicious anti-Atari spewage (while he's still using one!) towards their computers and users both must be taken with a 50 kilogram bag of salt, as opposed to Ofir Gal, a professional writer who uses several different computer systems and who knows the ins and outs and quirks of each particular system, as well as having a clear, cohesive writing style, I know who I'D rather believe.

Not to mention the other people who have a chance to work with both PCs and Ataris and who prefer the Ataris hands-down for their ease of use, more sensible operating system and memory management, and the fact that they don't require hard drives with a gazillion megabytes to store their software on (because the software is a manageable size to begin with).

So John Townsend thinks the Atari operating system is no good. Well, Darek Mihocka, the developer of GEMulator for the PC (and a Microsoft employee), thinks that Windows 3.1 and 3.11 are an inelegant joke, and that Windows '95 (that even in the final beta is experiencing major problems) will prove to be an even bigger joke if and when it's EVER released. (He does think the best PC operating system is Windows NT).

And my developer can beat up your developer :)

_Dan (not a useless, snivelling, STOS-using teenager on the dole, but an AMAZING SIMULATION! At least to Roger Sheppard, who really needs to pry himself away from the computer keyboard and go out into the streets and learn about real life....)

S > Atari made a big step backwards when they brought out the ST,
S > they should have gone for the Mindset Computer that they had
S > the option on...

Funny, Roger, but from the press I've read from 1985 and onwards in a variety of publications over the years I've seen that there were a lot of accolades over the fact that the ST was, for its time, a very revolutionary computer - better colour than a PC, a stable, easy to use GUI interface (that NO PC at the time had), and standard MIDI ports (which to my knowledge gave it an edge that made it a favorite in MIDI studios). Who knows what might've happened had the Tramiel boys had exhibited even an ounce of business sense?

And, pray tell, where is the Mindset NOW? At least, despite the fact that the ST isn't as popular as the PC, at least it's a KNOWN computer line!

Wait, I know how you'll reply to this one - "those journalists were all snivelling useless teenagers on the dole who were waiting for STOS BASIC to be created so they can program insipid little games to bring my blood pressure up and write stupid, factless spewings disguised as gospel because I'm a bitter grumpy old man with no life of his own who wishes I can dump this stupid computer because I want to be a mindless sheep who goes all gooey at anything with Microsoft in its name. And so's your old man!"

Get a life, Sheppard (or get a PC, so you can leave this conference and leave us free of your claptrap).

... Microsoft is the QUESTION - and the ANSWER is NO!

BRAVO! BRAVO! You're handling ol' Roger the only way he can be
handled, with the toughest antidote there is to his wibblings - pure
reason and fact.

Next you'll get the ultimate seal of approval - when Roger tells
you to get a life or a PC.....after first calling you a snivelling
STOS-using useless teenager on the dole, of course..... :)

... REAL oatmeal should be thick enough to stop a bullet!

R > What type of IBM, Ken? I have a WDS3160 which I'm having
R > trouble getting up to steam. Anything particular you had to do
R > to yours? Would previous use of the Stacker make things
R > difficult?

that's interesting. I recently bought a used 100 meg IBM drive
which has a similar number (WDS3150?) and am having a couple of
problems using it with the Link II:

1) it doesn't seem to like my original Conner 40meg drive, in
fact both drives absolutely refuse to boot if they're both
connected. They both have different device numbers, BTW, so I've
tried that. The IBM and my NEC CD-ROM drive both work OK together.

2) when used as my main drive, I have to warm boot the computer
after first switching it on after switching on the hard drive to get
it to recognize the IBM mechanism (which is weird, as I've had no
similar problems when using the Conner as my main drive).

If anyone has an idea on what I can do to reconfigure both
drives so they'll cooperate with each other, and not require a warm
boot to get going, it would be much appreciated......

... The only stupid question is the one you're afraid to ask.

Any ST with a 720K floppy can read DOS formatted 720k disks. Format on your PC. There are PD & shareware
programs that will let you format DOS on the ST, but I don't know the names. PC Ditto, a software
PC emulator came with one, as I remember.

Good Luck,

On 22 Apr 95 Peter wrote::

PK> Question: is it true that SCSI drives operate slower on a Falcon
PK> than on other computers? And if so, why?

A statement phrased in such a general way can't possibly be true.

For a given SCSI drive it's performance on various computers will be
determined by:

1.SCSI bus data rate.
2.Efficiency of disk driver.
3.Efficiency of operating system file utilities.

Without knowing all the details it's impossible to say but the user can
usually only influence 2) and I have heard that the Hushi driver is the
fastest on the Falcon

Thanks for that info. Jon. It looks as though the trouble is the Supra h/a.
I got 3.5 after complaining to Hi-soft but it didn't make a blind bit of
difference.

I have plans to replace the Supra h/a with an AdSCSIplus some day as I find
I would like the ability to drive devices which have parity permanently
enabled.

What's the prob? Have you tried it? In most respects the disk formats are
completely compatible. The best formula is to format the disks on the PC.
Otherwise there are a number of formatters for the ST which put in the bits
that the PC is particular to.

1312. A most obvious FAQ, and some other Q's

Newsgroup: comp.sys.atari.st
Date: 1995-04-23 00:00:00 UTC
From: gkomatsu@uhunix3.uhcc.Hawaii.Edu
Message-ID: <D7HLo2.7LB@news.hawaii.edu>
Source record: 167096

Skimming the headers of the 500 or so articles in the news
queue here hasn't revealed any, and I couldn't find anything (in a
mild search) at rtfm.mit.edu, so I must ask...

Were might I find a FAQ for this group?

any point in the right direction is appreciated.

This afternoon I found a 520ST in a thrift shop (included
mouse, SF314 drive, some mystery-unknown name 5.25" drive, and
appropriate power supplies) This at all a good computer? (use
your own definition of "good computer" if you respond) ...at all
a good computer considering I picked it up for about us$13.00? =^)

While things seem to work, at the immediate time being,
this is an even "worse" computer than my Apple //e, 800xl, CoCo3,
and Commodore plus/4 (all but the first I never use...) mainly
because I have no software to boot up...all I can do right now is
click on menus with greyed options, and change the display
resolution. funfunfun =^)

Is there any kind of built in self test?

What kind of drive is the SF314? DD? HD?

What kind of boffo cool stuff can this puppy do? (and
where do I get started?)

Where does the 520 stand among the ST computers? (and
what does "ST" stand for anyway? =^)

>on it.

Sure, i have heard this before. I have been at this market ever since 1986.
All the time i hear statements like the above, and many times i see nothing.

>(2) The number of Medusas sold is a nearly neglectable market. And the

1317. PPP programs

Newsgroup: comp.sys.atari.st
Date: 1995-04-23 00:00:00 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <FDXRBDUUUp@stingray.manawatu.gen.nz>
Source record: 167138
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Which is the best program to use for PPP?

I'm currently trying to install PPP on my 1040ST (TOS 1.02, 1Meg, 40Meg HDD).
I've only read the docs so far and hope to start trying to install it
tonight, but wanted to know if KA9Q NOS is the best, or if not, which is.

Thanks,
Richard.

But I presume somebody (probably the University) is paying for it which
is the point - the WWW is expensive for the average home user.

> is not capable of doing what we PC and Mac users have been doing for
> awhile...
>

Fine and my Falcon does DtoD recording straight out of the box - and
can control a full synth setup - again straight out of the box. All that
is required is the software. The ST has been doing MIDI since it came out
10 years ago - something that the PC still can't do unless you buy an
additional card (which probably only works with one package). Lets face
it the PC is a jack of all trades and a master of none - but its users
think it can, and want it to, do everything perfectly which is an
unrealistic point of view.

OK my Falcon can't do WWW - but then again neither can an awful lot of PCs
and Macs. But it is fine for trawling the Usenet which is why I am on the
Net - for interactive conservations.

My opinion on what? Multi media ? If so then find me a PC that does
256x oversampling bitstream audio, Nicam Stereo, Dolby Surround
and can push audio out at over 100W per channel - no contest I think!

> "Peter Sinclair, you are a tosspot; you are a wanker; you are a very
> tiny piece of turd."
> - Atari's Jeff Minter

As far as I know (and I used to live round the corner from him in Tadley) Jeff is a freelance software developer who develops for any machine that takes his fancy (Does he do the PC and Mac I wonder). However I think he is right 3 times over.

Now can I suggest that if you have nothing constructive to say why not get lost eh?

: platforms have droped by the way side, Facts can't lie....

Well, PCs became the standard in the late 70s/early 80s, and today
they're home machines. Their architecture isn't necessarily the best,
nor are they technically getting the best performance from their old
software. However, it seems to me that Intel has made MORE powerful
processors in order to overcome these deficiencies.

PCs have a hell of a lot more software, so you're allowed to have some
decision making in what you want to buy. In this sense, the Falcon 030
would be a much easier decision to make.

>Perhaps you would, if you're going to base you company on old machines. But
>while 2B and Heidleberg are dumping program for the old machines, people

I have no idea what you mean with "dumping" in this context ...

MagiC3 was basically ready, still short of the Falcon specific stuff, so why
not release it!? That's all there is to it. 2B are not very happy about this
step, but that is an entirely different matter.

But you've tought us in _several_ previous mails that you have absolutley NO
idea of anything related to running a business or making profits.

>on the Falcon, (and newer Tos compatible machines) are going away from the

ROTFL. For example? For the handful of Medusas or Eagles?

The Medusa is fast enough to even run MultiTOS at an interesting speed. And
the targeted market for a 040 or 060 clone doesn't necessarily need MagiC3.

>they never manage to support newer, and their company will eat itselves from
>behind, (if you know what i mean).

Hardly. You speak in riddles ...

>and not supported 386 and 486. And just try tell me how many companies would
>do a thing like that today, and survive the market as well ? Heck, now they

Do you have any idea how many everyday-applications make _real_ use of the
advanced features of a 486 or Pentium? IMO, this figure would be real close to
ZERO.

>Normal way to do things, is to write a new program which is backward
>compatible, (if thats what you want/need). But i guess backward is a word
>Heidleberg isn't aware of.

Huh?

MagiC3 is perfectly backward compatible with MagiC2. Doesn't run on Falcons,
either :).

But if you don't like it, go ahead get your own business going, hire some programmers, and try to develop s. th. new.

Hey, you could even dump backwards compatibility, then (which would be totally stupid, as it cuts your prospective market down to about 10%), but that's the way you want to make others go ...

Then try to survive. Welcome to the REAL world, pal.

: Also what is wrong with this "shareware" being expensive? Do you
: think that Papyrus is shareware because it has a demo available?
: Or is it more a fact of "It's called shareware so it must be crap"?

In a shareware (or similar) scheme, the author gets all of the shareware registration fee. In commercial software there are distribution costs, and usually more in the way of expensive packaging.

This said, it stands to reason that shareware should be significantly cheaper than commercial software (for a similar product).

I agree that the registration fee for CoMa is too expensive - I only send and receive Faxes infrequently, and so can not justify the cost. There should perhaps be a 'lite' version for low users such as myself.

At the moment, I would use CoMa except for the cost - so I use Junior Office, which I have recently translated into English. Look out for it very soon on Hensa and others... Denesh (dbhabuta@cix.compulink.co.uk) will be handling UK registrations which will cost #15

YES! Move it. A 'friend' of mine put my monitor on top of a speaker and
the bottom edge is bent permanently as a result. In fact, don't put any
magnetically sensitive stuff near speakers (ie tapes, disks, computers etc).

> 3) Simply turning the monitor, and especially the computer on, adds

Try putting the computer on a separate power socket. I don't have any
problems with mine. Try to move all cables so as they don't interfere with
one another (ie, don't have audio and power cables running close to each
other, as they may cause interference.

On an ST you'll need external hardware to do digital audio. Probably the best bet is Cubase/Logic with one or more Yamaha CBX-D5/3 units.

Or upgrade to a Mac/Digidesign setup. None of these are currently particularly cheap. One day...

1334. CLAv3 - more Beta testers required.

Newsgroup: comp.sys.atari.st
Date: 1995-04-24 00:00:00 UTC
From: "Craig. Graham" <Craig.Graham@ncl.ac.uk>
Message-ID: <3ngl6u$t9d@whitbeck.ncl.ac.uk>
Source record: 166955

Hi. I'm now a fair way through coding v3 of the CLA digital CAD system, having fixed all the problems from my first couple of beta releases.

I will be sending out the next test version at the end of this week, and as monochrome & 68000 support has now been added, I find I need a couple of people with plain vanilla ST's to test it (currently all my testers have TT's & Falcons).

I need....

512K/1Meg/4Meg ST & STE users. Small systems are really what I need right now, as I already know it works on larger systems (development machine is a f030 4/32Mhz). Only one or two, but it needs doing.

People with previous ECAD experience preffered (Intergraph, Mentor, GalaxyCAD, etc) but anyone can have a bash...

Info about what CLA is can be found on my WWW page:
http://www.ncl.ac.uk/~n08z7

v3 is a complete re-write from v2, and should run on almost all machines (ST-mono upwards), even in 512K (v2 required 1Meg minimum, 2Meg for serious work).

Anyone who has already done testing for me will be getting the new version in their mailbox RSN, so no need for them to contact me again.

Craig.

Well after being harried by various people to update the
TCPIP.FAQ or the guide to Atari computer Networking (or whatever ;)), I
have decided to give it a try. Work has loosened up a litle bit so
hopefully I'll be able to get it together.

So now's your chance to get involved. If you have anything to be
included drop me a note. Anyone who would be up for helping is
definately welcome. There is a lot of work to be done on bringing it up
to date. So if you are running Xwindows/MintNet/Ham Radio or whatever
and are willing to volunteer some help drop me a line.

Thanks,

Dan Ackerman
aka baldrick@terminator.rs.itd.umich.edu

Of course it's capable, don't be silly. ATM there aren't any, but they are
being written - Demon are in the process of producing one and so are other
s/w houses.

BTW I use a PC at work, and hate the thing - I made sure it was a 33 Mhz
486SX with a 256k cache and a video acc just so that it was fast enough
not to drive me nuts, as you know Windows is SLOW.

There is a file (FALCADAP or FLCNADAP) that shows how to produce a
switcher for a multisync, this might be adaptable to what you want - at
least it will give you the important pin outs (M0 and M1)

Yeah, but without more info it's not possible to say for sure. If he's a real novice he could just have two NEWDESK.INFs set up with a boot manager where one has the drive G icon and the other does not - but I prefer your answer :)

There must still be another problem, then.

Why should the ICD-booter not work on a TT? Which version do you use?

Have you installed the driver properly on the TT's drive? Or did you just copy the driver?

I have a very light memory of a problem occurring, when the booter is installed from one machine, and the harddisk then is connected to another type of computer.

Run HDUTIL, make your TT-drive bootable, and then choose a driver from the original distribution-disk. Setup the params as you like, and do *not* _deselect_ the ID of the harddisk in question.

Does the TT run MagiC as well? If so, try to make it boot correctly under plain TOS and then fire up MagiC.

Bye.

That's right. It's built into the device.

RG> Actually I suppose the real question is - just what *is* active
RG> termination - and how on earth do I tell it from the passive sort? ;-

I used to know this but am blowed if I can recall. It involves continuous monitoring of the bus and adjustment of the termination circuitry to ensure no signal reflection. The passive terminators are a compromise.

Physically I think you can spot an actively terminated device because it doesn't have the DIL resistor strips.

Peter,
Speaking of disinformation, I'd say that to critique TOS/GEM, you should actually use it. This is just my humble opinion.
If you look at previous threads you'll also see that there is a disk collection with an installation program that gives Atari users World Wide Web access.
Also, I don't believe that you own the latest Mac, do you? Well, yours is outdated. You should upgrade regardless of anything you say. Why? Well, because you seem to think that TOS users should switch to the Mac just because it is newer. Leave us alone, Pete, and continue using your Mac. I will keep using my Falcon. Ever notice that Atari users seldom post to other computer groups?

Since I just found an NEC Multisync 3D monitor lying around our office, I will probably attempt to use this with both my STe and my Powerbook 540. I just need the right adapters. Are there any docs that will tell me how to make them?

I figure that I would rather invest in some decent commercial programs for the ST, such as a wordprocesser, spreadsheet, and database program. All of these would need to have standard export options so that I could hopefully inport file information into Microsoft Word, Excel and Filemaker Pro. Any suggestions would be helpful.

Generally I found the 1st issue of Atari World very similar
in style to ST Review, although it clearly divides its
coverage into different areas, all Falcon related material is
in one section, and a beginners quide to the ST is in another.
The rest is all general material and is written to a very high
standard. Its 98 percent computer coverage with only one Jaguar
review.

The only layout complaint I have is that there was a lot
of aliasing on some of the advert graphics.

The content is superb, and for me strikes just the right balance
in catering for the expert and beginner alike.

There was also a healthy amount of adverts including one from
C-lab.

Distribution is superb, its been in virtually every 2-bit
newsagent I've seen.

I have a couple of questions though.

Will Atari Pro be Falcon orientated every month?

Will Atari Pro and Source continue to be provided as
separate sections or will you merge them into the magazine?
In the shops I've seen the different sections have become
separated and have migrated all over the magazine racks.

Can we have some programming tutorials which cover complex
issues, not just the usual opening a window kind of thing.

Les

I have to add that I've been using the various versions of NeoDesk since I bought my ST(many years), and I've found it to be one of the most reliable and stable products I've ever used. It must depend on the system you are using (though mine is pretty strange at this point). I certainly have never had any of the problems mentioned above; Window colors are always fine etc... Sometimes other programs will effect the color palate and not restore it properly upon exiting, there is a hot-key sequence in NeoDesk to fix this problem.

Geneva has also been extremely reliable (ST format gave it an excellent and IMHO very accurate review/comparisson with Magic (MagiX?). The only one of my older programs that won't run under Geneva is Wordup 3.0.

As a user, not a programmer, I have found both of these products to be excellent, now I just have to break that 4meg memory barrier ....

A SCSI II active terminator looks exactly like a Passive terminator but they
are normally marked as 'ACTIVE TERMINATOR'.
Inside is a Voltage regulator that drives an individual 110 ohm resistor to each
signal line with a voltage of 2.85 volts. For the curcuit see the SCSI 2
standard, X3T9. The one I have is a DRAFT dated April 28, 1993.

: Rod, why are you trying to reinvent the wheel? There's a very
: well-advanced organisation that holds these details and more called the
: Falcon FacTT File.

: If you want to know more, contact kbeardsworth@cix.compulink.co.uk or
: colinfm@cix.compulink.co.uk or find a UK BBS that's in the NeST network
: and join the group N.FALCON.FACTT_FILE

I'm not really trying to re-invent the wheel, indeed I was unaware that
there was a list of falcon owners already available!!

If this origanisation would like to publish its list on the net
then I'm sure a lot of people would be very grateful. :) I know
I would.

Rod

Wrong, i didn't tought you anything. I simply told you my opinion.

HM> ROTFL. For example? For the handful of Medusas or Eagles?

I doubt that.

HM>
HM> The Medusa is fast enough to even run MultiTOS at an interesting speed. And
HM> the targeted market for a 040 or 060 clone doesn't necessarily need MagiC3.

The Medusa yes, but how many people do you think are going to buy an
Medusa ?

HM> Hardly. You speak in riddles ...

Well, to make all people understand i simply have to.

HM> Do you have any idea how many everyday-applications make _real_ use of the
HM> advanced features of a 486 or Pentium? IMO, this figure would be real close to
HM> ZERO.

You need to learn alot about the PC market, cause you have no idea what
you're talking about. Windows and OS/2 are shit (well, OS/2 seems to do
better now). Windows and OS/2 on anything below an 486 DX2xx is a very BAD
idea if you need to do some serious work. You just start counting how many
Windows users who is out there, and you'll have a fine picture of how many
people are using 486 and better, (or will in the future). And my guess is
ALL OS/2 users are using minimum a 486 DX2xx.

HM> Huh?
HM>
HM> MagiC3 is perfectly backward compatible with MagiC2. Doesn't run on Falcons,
HM> either :).
HM>
HM> But if you don't like it, go ahead get your own business going, hire some
HM> programmers, and try to develop s. th. new.

If i could i would have done it long time ago myself.

HM>
HM> Hey, you could even dump backwards compatibility, then (which would be totally
HM> stupid, as it cuts your prospective market down to about 10%), but that's the
HM> way you want to make others go ...

What makes you say bakcward compatibility is lowering your profit. Thats
stupid!

HM>
HM> Then try to survive. Welcome to the REAL world, pal.
HM>

I live in the real world, Pal! One day you'll be supprise.

1369. Re: Aamdeus-Music Writing Software

Newsgroup: comp.sys.atari.st
Date: 1995-04-24 00:00:00 UTC
From: Wolfgang_Nimmerrichter@a2w.maus.sub.org
Message-ID: <199504241405.a23659@a2w.maus.de>
Source record: 166990

Amadeus is a professional music-software which generates complete artwork
including titles and headlines, lyrics, guitar diagramms, performance notes.
Input through keyboard or MIDI devices, realtime or step by step, computer
keyboard and mouse.
It includes a 30-track sequencer, editors, keyboard split, stylistic
interpretation, predesigned layout templates.
The Amadeus-package contains an English manual, 8 diskettes, ROM-Modul, the
Idris operating system (Unix look-alike) and 12 typesetting fonts.
As far as I can remeber the price was appr. 5.000.- DM (4.000.- US$).
Further infos maybe at (don't know if it still exists there):
Amadeus musicsoftware
Rohrauerstr. 50
D-8000 Muenchen 71
Germany
Tel. ++89/785 4750
Fax ++89/785 5310

I think they have a *very* strong will to do anything for the ST market, espacially a game of this magnitude. Everyone will compare it to DOOM and think it's trash, but it's not! You can't compare it with anything whitch needs > 486DX 50 to run at a decent speed. Have you all forgot that the ST is a computer designed in the 80's? and were a very powerful computer at that time. Take a PC from the time when the ST came out and try to play anything on it! I know that Substation is for the STE, but don't fool your self by saying that Substation is crap. Nobody have even seen Substation yet playing! Nobody have heard the andvanced high quality 3D sound! and all this on a 8MHz 16 colours computer (they use dithering to get 32 colours)! If its not good enough. Do it your self! (I'm not shouting on you Doug ;)

ACE of America, an All Computers and Electronics User Group, with a special emphasis on Atari. At ACE Swap Meets you might find Atari, Apple, Macintosh, Commodore, Amiga, IBM & Clones, Nintendo, SNES, Sega Genesis, Jaguar, Game Boy, Game Gear and Lynx. You could also find the following items to go with your system, such as Printers, MoDeMs, Monitors, Hard Drives, Disk Drives, Power Supplies, MIDI Devices, Mice, Joysticks, CD Roms, Cables, supplies and Accessories.

ALL COMPUTERS, GAME MACHINES AND ELECTRONICS ARE WELCOME!!

ACE will be holding a combination RAFFLE & SWAP MEET on Monday, June 5th at 7 P.M. It will be an ALL Computer & Electronics Swap Meet with various Raffle Prizes. Funds raised by the Raffle will help us to continue presenting these Swap Meets. Donations of Raffle Prizes will go towards this or Future Raffles. Raffle tickets will be 2 for a $1. And members of ACE will receive their first $1 worth of Raffle tickets FREE! And the final prize of this Raffle will be $25 in cash from the Money Raised by the Raffle. Prizes will be laid out for all to see. Winners will get their choice of available Prizes on display, with the Cash Prize held til the last Drawing. Drawings once be laid out for all to see. Winners will get their choice of available Prizes on display, with the Cash Prize held til the last Drawing. Drawings once started will be every 10 Minutes. Prizes will vary depending on Donations, so to Help make this Raffle a Success, Please be Generous with your Donations. To Donate, call (503)256-9974.

Monthly Swap Meets are Held on the First Monday of each Month from 7 PM. Swap Meets are Held at 1819 NW Everett at the NW Service Center 3 Blocks North of the corner of 18th and W Burnside in Portland, Oregon. USA! Table space is $10. Tables provided as long as they last. Show up early to get a good table, like 6:30 PM.

The Next Monthly Swap Meet will be Monday, May 1st at 7 P.M.

1374. FS: Digidesign Sound Tools editor for DAT

Newsgroup: comp.sys.atari.st
Date: 1995-04-24 00:00:00 UTC
From: drichard@execpc.com
Message-ID: <3nf5k0$64t@homer.alpha.net>
Source record: 167005
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,fr.comp.sys.atari,comp.sys.atari.advocacy

For Sale: Digidesign Sound Tools system for Atari Mega ST. Note, this system REQUIRES a Mega ST because the DSP board plugs directly onto the Mega ST's bus. I paid over $2000 for this system, and am asking $450 or best offer. It's in very good condition and comes with original manuals, etc. If you're unfamiliar with the system, here's what it does:

The Digidesign Sound Tools system is a hard disk digital audio recording, playback, and editing system. It can be used for mastering CD's, tapes, etc. or for editing digital audio. The system I'm selling consists of the following 3 components:

1) DAT I/O digital interface for doing direct digital audio I/O (entirely in digital domain) from DAT, Mini Disc, DCC, or a CD player that has digital output. It has both AES/EBU and S/P DIF ins/outs. This is a separate box with cable that plugs into the DSP processor described below.

2) The Sound Tools DSP, a Motorola 56001 DSP processor on a 'card' that plugs onto the Mega ST bus. This processor speeds up DSP functions, and allows things like realtime EQ during playback.

3) The Sound Designer II software. This is the software that drives the hardware described above. In addition to recording and playing back digital audio it includes cut and paste editing, scrub editing, EQ, waveform redraw, normalization, regions and playlists, fades and gain changes, smoothing, mixing of sound files, sample rate conversion, and time compression/expansion.

In addition to the components described above I also have final beta copies of the Digidesign MasterList software (For putting together a Master List of several songs with timing, blank space, etc. for a CD or tape).

If interested in this system please reply via Email to drichard@execpc.com.

Thanks,

Dean

There is a small device available now, used in portable coolers and portable heaters. It's a freon-less system. In fact, it doesn't contain any moving parts. Its a tiny device, about as long as the a large IC (smaller than the mc68k).

I'm not sure how it works, but you apply DC power to it. If you connect it one way, it gets very hot - reverse the wires and it gets very cold. I was wondering if anyone knew about these litt;e devices - glue one to the CPU and another to your hard disk and you won't need any annoying fans.

If they use the DSP in the Falcon, they would be able to achieve the same speeds as PC's.
The DSP is about 12 times faster than the 68030 in 3D texturemap calculations.

Just look at TOWERS II.

You're talking crap (or, rather, what you're saying doesn't suit me). :-)
The most important thing a shell has to do is run a program. Natch, Ease
does this. The second most important thing is to set the environment in
which those programs run. Ease does NOT do this. It's not just for
programming, things like POVRAY, GhostScript, Emacs, and others use
environment variables.

JOHN AMSLER (amsler@nevada.edu) wrote:
: I don't think I understand what's going on at HENSA. Is it about to be
: shut down because there are *too few* people dialing in and downloading
: TOS software?!?

Basically, the PC and mac sections are used the most at HENSA. Because
of this, the Atari and Amiga sections may close as they are not seen
as viable/educational type machines by the funders.

If the Atari section is being used a lot, then it will stay...simple
as that. We have a review coming up in a couple of months, and we have
to provide stats of useage over the next month....and I want to show
that the Atari section is used...which I know it is, but not as much
as the PC or mac.

Hey, folks, I am a Falcon owner, too, and sure enough I'm eagerly
waiting for Magic for Falcon, but do you think the quarrel about
B&B, ASH, TTs, STs, etc is all that productive? Let's just do what
we Atarians are experienced in: wait and see.

I'm convinced the Falcon version is going to be the hit of the year,
IMO.

Regards to all y'all!

Message-ID: <798709882snz@ivecoft.demon.co.uk>
Source record: 167020

Hello all.
I'm trying to get my STe to bootup without using MagiC & Ease from the hard disk. I have tried the holding shift keys during bootup but it has no effect

What I'm (my son) is trying to do is have Monkey Island on the hd to save the swapping of disks but of course MI is not compatible with MagiC/Ease
Can anybody offer advise?
Cheers

>it has something to do with grounding

MIDI ports only use the top three pins of a 5-pin. The top pin is the
ground, and the two pins either side are used for the MIDI out signal. The
other two unused pins to output the MIDI thru signal. This can be a problem
if you are using non-MIDI 5-pin DIN leads, as some of them wire the two
used and two unused pins together. It's nothing to do with grounding.
The MIDI IN port is fine, only the out port is non-standard, and if you
use proper MIDI leads, it won't be the cause of any problems.

One way to do this without removing the SSI code is to waste an address register and use only fast interrupts with one output instruction. This would, of course, require left and right channel data to be interleaved.

You could then guarantee a very short delay, which could then be taken into account on the 68030 side. It depends on the latency of the DSP code, so some DSP routines may fall behind the 030, but it would be worth a try if the DSP is not executing too many instructions per 030 read.

IU> BTW, if you have any detailed information about the DSP I would

> As I've said before, Kim, the *delay* is because B&B are intent in making
>the best possible use of the DSP to make MagiC faster. Heidelberg merely

This is nonsense because you cannot use the DSP to make the operating system faster. The DSP is limited in its range of applications to funtions that profit from special features of a DSP directly. TOS or GEM or MagiC are no such applications.

>insisted on releasing MagiC 3 before it was ready for the Falcon. And yes! I
>agree that this was a stupid move. There we go agreeing again! 8^)

Do you think those who have an ST or TT and which can run MagiC 3 NOW think this was stupid, too? Don't forget that most users have an ST. Falcon users are a minority.

Linux only runs on machines with at least a 68030 CPU and an FTP. It will
never run on an ordinary ST.

Silly question; are you rendering at 4x3 or 4000x3000?
Of course raytracing is slow, it's slow on most machines. I do initial
work on the Falcon, but for real rendering I have to move to a fast Unix
machine.

You could also try the Falcon version of Faster Than POV, it's on CIX
in atari.st/2listings.

> sometime methinks!

Griff pointed out the problem to me via E-Mail, it's so obvious
when you think about it ;-)

What happens is that the 030 interupts for example, just before
it is about to take some data from the host port.
Then you signal a host command interupt, but the DSP has already
sent some data to the host port that was meant for the intruction
that just got pre-empted. I hope you follow that bit!

So of course next time your 030 interupt does a read from the host
port it gets the wrong peice of data. The solution is to see if
there is any data pending at the start of the 030 interupt. If there
is some data then read it and save it.

You are now safe to do your tracker stuff as normal. Then at the
end of the DSP interupt signal the 030 to send that 'lost' bit of
data that you saved earlier. Then as soon as the DSP recieves it
you send it back to the 030. When the cpu returns it reads the host
port and the correct peice of data is waiting there for it!

Yes it's a bit complicated, but it doesn't end there, because you
have to do the same thing at the DSP end!

I hope that poor explanation helps.

I've got another problem now! I've converted the DSP tracker routine
to not use the SSI, but send the data back and play it using DMA.
The reason for this is to prevent the SSI interupts from changing
the timing critical parts of the other DSP routine. Perhaps I
should have mentioned that I'm not using full handshaking, only on
the DSP side, to save cpu time, so any speed change on the DSP
side could cause data to get missed on the 030 side.

BTW, if you have any detailed information about the DSP I would
be grateful if you could mail me, particularly info about the
SSI registers. Cheers.

Alan.

Sure there are more. Especially if you count STe compatible games, that are
Falcon-enhanced.

Here goes the ones I remember :

First Falcon-only versions:

PINBALL DREAMS
ISHAR - Legend Of The Fortress (RPG game)
ISHAR II - Messengers Of Doom (RPG game)
ISHAR III - Seven Gates Of Infinity (RPG game)
TRANSARCTICA
STEEL TALONS
ROAD RIOT 4WD
MOONSPEEDER
OXYD GENERAL (also TT)
OXYD MAGNUM (also TT)
N.O.B.I Racing (also TT)
DINO DUDES (not released yet, but RSN)
H2O (from E.K.O.)
LAZERS AND MEN v.2.0 (Wolf3D like game)
BOMBSQUAD (Cute shareware game, with nice graphics&sound)
LAZERZOOM (Haven't tried it yet, I think it's from germany)
DINO (from PARX)
MULTI BRICKS (up to 4 players)(from PARX)

There are some more, but can`t remember. I'll have to look again.

And now for the STe compatible games, which are Falcon-enhanced:

STARBALL (the well-known shareware pinballer)
ZERO-5 (VERY fast & slick 3D shoot`em up from Caspian Software)
FRONTIER (Not enhanced, but a LOT smoother/playable on Falcon and TT)
STARDUST (from Aggression/Bloodhouse)
FRANTICK (from MUNSIE)
ASTROROIDIA (from MUNSIE)
ULTIMATE ARENA (French Mortal Combat style game)

Here there are also more, again I have to refresh my memory :-)

Hope this helps.

Keep Cool and Flying...

ChainXOR...

If you`re talking about the Falcon-version, I think graphics and sound are VERY nice indeed. The game is very atmospheric.

By the way, try ISHAR III - it's even better :-)))

Keep Cool and Flying...

Harump! :-) Looks like a MiNT flag to me. The ICD boot software works fine
as a PRG when it is in the AUTO folder, BTW; it's the same file, renamed
from SYS to PRG.

I personally think it's wonderful to see how Vic and his team cannot be held back from the newstands. EMAP booted ST Review, but they went to Europress. Then when bought out by Pearsons, they have survived to bring us a new exciting venture into the Atari future. I do have doubts, however, on the security of the publisher, Neil O'Nions of Compo. Can he afford to run his business, AND produce a magazine. It's a hell of a gamble and one which can only be applauded. I do therefore urge all Atari Owners to read and support this new magazine. I personally love it, and the idea of ST Source is a great one, and one I could have done with 3 years ago when I first bought my STE and did not have a clue how to use it properly. I will subscribe as soon as I can.

Long may Atari World reign!

Cheers,

Dave.

>: the user doesn't like or does not understand but there is often a very
>: good reason for it and usually it's profit based. That's business, ya know?
>
>We know. Too well, Hutch... But the question should be: do we *want* it ?
>
>If "business" forces us to buy bullshit, it's time to say "no" !

My 'romantic' spirit wants to agree with you but like they say, 'reality bites.' :) In the real world simply saying "no" when businesses make an unpopular decision doesn't usually help us get the job done nor will we convince the business decision makers to change their minds to suit us.

The -reality- is that Atari users simply make up far too small a segment of the population (i.e., the 'buying public') to wield much clout.

OK, but the real question we need to ask ourselves is, "So what?"

>If I have to use a PC to get some job, I'll do it. But at home I will use
>whatever I _want to_ use. And that's Falcon. That's our own choice,
>whatever the business-brains try to decide =-) !

And that's -exactly- the proper attitude to have, too. It doesn't matter what computer you or I use as long as it meets our needs sufficiently so that we are happy with our individual choices. That's ALL that counts.

Well said, Tommi.

Cheers,

-Hutch- @ Fair Dinkum Tech

It's Neodesk 4.02, btw.

I just checked back through the thread; it was me you were quoting, not
Roger the Cabin-Boy.

And, if you're Beta testing, didn't you also find that window colours come
up wrong? Didn't you also find that it frequently bombs if you go into
the "gadgets" dialogue twice?

Message-ID: <D7Kxtx.B0K@news.hawaii.edu>
Source record: 166852

This weekend I got a 520ST with floppy drives mouse and
nothing more. As best as I can tell, this computer is capable of
doing absolutely nothing...since I have nothing to run on it. =^)
Several questions.

- where can I find a FAQ? I spent the weekend visiting numerous
sites only to find nothing of the such.

- what are the general specs of the 520ST? speed memory resolution
etc etc etc...

- can I hook up my NEC Multisync 3V to it? (since I doubt the TV
would do it justice)

- what would I need to get Linux up & running on it (for starters
I know I'd need a HD...size?) is it capable of running
Linux?

thanks.

1422. Garbage collection in Magic

Newsgroup: comp.sys.atari.st
Date: 1995-04-25 00:00:00 UTC
From: Koos_Kuil
Message-ID: <2f9d4af1@f397.n282.z2.fidonet>
Source record: 166853

To: and@sun1.mim.uni-hannover.de

Hi Andreas,

I think you can maybe tell me more, i posted a msg in one of the german message areas that it's not easy possible to generate a memory garbage collection, do you have any idea?

I'm using a old upgraded ST with 2,5 Mb. When all programms are started i have approx 600 Kb free memory, but when one is terminated and another one is started it's sometimes possible that 100 Kb or less then this is free but the real free memory is 600 Kb. How can i get Magic so far that he does a memory-cleanup without terminating the applications and restarting them?

Do you think that this is possible?

How do i start an application in "Hiding" mode? (It means that when i start it from Magicdesk and press later "Hide appliaction" but now automatically).

Please open your trick-box, i want to use them ;-))

PS. Do not come with a "buy a memory upgrade answer", i can swap in a few minutes my complete environment by a 4 Mb ST or Stacy, but this one does run on 16 Mhz and the others not). A bit of C or assembler will be appreciated much more, i like the ST and the cheap environment with small software they can do heavy things with your computer. (Like more then 6000 cps on 8 Mhz)

Greetings,
Koos

The very last version of Superboot (8.1, IIRC) was Falcon compatible. I used
to use X-Boot but since the appearance of Stoop (shareware, ?10) I'll never use
anything else. Much better than X-Boot IMHO.

B>
B> Who is it you think IS marketing the Atari Jaguar, if not Atari..?

I think that what was meant was that it isn't Atari Corpse doing the marketing. At least not outside the US. It's up to the individual agents in each country to provide the marketing. In Sweden this means Adastra. To date, their marketing has consisted of adds in a small PC magazine, TV ads on a very small independent TV channel which only reaches about 20% of the population (for about 2 weeks), a single ad in an Atari club magazine and sending a truck rolling around the country without prior notice, parking in a shopping mall parking lot and just standing there for a day or two. Said truck contained 8 Jags and was staffed with two guys who hadn't ever heard of Atari until about 3 weeks earlier. The outside of the truck was decorated with the Jaguar eyes (one pair on each side) and absolutely nothing else!! Nothing to indicate that there was anything inside the truck. They got about 150 visitors during a 2 week period. This is marketing???

I think you've got the names mixed up, Hendrik. CoMa just came out with a new version, it certainly does support Modem 2 and is actually pretty easy to set up. I think you meant to say these things about Q-Fax. All the above are true of this program (which I use regularly). I'm about to register CoMa myself.

Well, some kind of marketing :-)

But it seems as if more marketing happened in Sweden than Germany. Or has ever
been a TV-spot on the screen in Germany? I think not only one has occured.

When I was in Germany around x-mas I looked out for the Jag in some shopping
centres. Finally I found one - on the lowest desk somewhere hidden behind all
the other systems. It was really difficult to find! (I actually had to ask for
it :-(

AB> Sorry to ask this but I can't see the original release - what has
AB> changed from v3.01? How do you upgrade in the UK?

The uppgrade is available through System Solutions. It's said to have better colour printout handling. It also exchanges the Hebrew characters in the Atari character sets into graphical characters, this has the unfortunate side effect of changing the contents of "bullet" fonts as well. I wish that particular function could be turned off.

HM> profits.

Part of running a business is also called "customer relations", Hendrik. And keeping the newer user of the more powerful machines locked out of an attractive program so long isn't good customer relations. I don't think it would have hurt the ST/STe crowd to wait 2 extra months for an *update* of their software (after all as you point out later in this letter they did already have MagiC 2.5) so that everybody could get the program. This argument is, IAC, irrelevant as the facts of life are that ST/STe users now have MagiC 3 (from what I've heard from Germany including a couple of fairly serious or at least annoying bugs) and we Falcon owners don't. We're not going to get it any faster by you and Kim flaming each other. We'll just have to be patient another couple of months (fingers crossed). After all we've already been waiting patiently for well over a year while everyone else has been able to enjoy their MagiC.

1439. F/S: *** NEW 540MB HD IN ICD FA-ST CASE (lower price) ***

Newsgroup: comp.sys.atari.st
Date: 1995-04-25 00:00:00 UTC
From: DOMINGO@news.delphi.com
Message-ID: <3nimak$lej@news2.delphi.com>
Source record: 166905

Plug-n-go 540MB hard drive for your ST/STe/TT computer. This hard drive setup is _BRAND NEW_ with a _FULL WARRANTY_. Now only $425.00 shipped to your door. (+$10.00 COD)

Here are the specifications:

o ICD FA-ST Hard Drive Case
o under-monitor designed case w/adjustable legs & fan
o DMA input and output ports
o external ID-switch
o external SCSI connector for further expandability
o internal expansion for second 3.5" SCSI HD

o ICD AdSCSI Plus ST Host Adapter
o full SCSI command set
o parity bit generation
o dual mode DMA daisy chaining
o battery backed real-time clock

o ICD Hard Drive Utilities (+$40.00 Pro)

o Quantum MV540S 540MB SCSI hard drive
o low profile 1" x 3.5" form factor
o 14ms average seek time
o 5MB/s max. transfer rate
o 128K cache buffer

CIS: 74030,3254 Delphi: DOMINGO GEnie: D.ALVEAR I'net: DOMINGO@DELPHI.COM

1440. F/S: *** NEW 105MB REMOVABLE SCSI HARD DRIVE (lower price) ***

Just add a host adapter to use this 105MB Removable SyQuest in an ultra compact desktop case. This hard drive setup is _BRAND NEW_ with a _FULL WARRANTY_. Requires the Link 2 (+$75.00) or other host adapter. Now only $350.00 shipped to your door! (+$10.00 COD)

Here are the specifications:

o External 3.5" SCSI Case (W6.5" x D9.75" x H2.375")
o horizontal Desktop or vertical Mini-Tower
o external SCSI ID switch & 2 SCSI ports
o 40W p/s & 1.5" fan
o second AC outlet

o Syquest SQ3105S 105MB removable SCSI hard drive
o low profile 1" x 3.5" form factor
o 14.5ms average seek time
o 4MB/s max. transfer rate
o 64K cache buffer
o 105MB cartridge _INCLUDED_ (+$50.00 for 2 carts)

o ICD SCSI Pro Utilities available (+$40.00)

CIS: 74030,3254 Delphi: DOMINGO GEnie: D.ALVEAR I'net: DOMINGO@DELPHI.COM

Source record: 166908

I'll have my new hard drive tommorow (SCSI external, 730meg) for my
Falcon and all I'm wondering is this:-

1. If I remove my internal IDE will it still boot from the SCSI external?
2. And if so, do I need to partition the SCSI starting from C: ?
3. And if so how do I copy my files from the IDE to the SCSI without
clashing the partition names and without using floppy disks.

I took the IDE out of my Falcon for a while, so I may be able to help here.
I used ICD Pro drivers, fwiw.

>1. If I remove my internal IDE will it still boot from the SCSI external?
Yes. I took the IDE out, booted from the ICD diskette, and installed
an autoboot on the first partition of the SCSI drive.

>2. And if so, do I need to partition the SCSI starting from C: ?
No. Your disks are already partitioned, TOS just assigns drive numbers
sequentially, ie the first HD partition it sees is always drive C.

>3. And if so how do I copy my files from the IDE to the SCSI without
> clashing the partition names and without using floppy disks.
See above! If both IDE and SCSI are connected, the IDE will be (say)
paritions C, D, E, and the SCSI will be F, G, H. If you take out _either_
drive, the remaining one will be C, D, E.

Falcons boot more slowly without an IDE, as they wait for a certain time
before deciding it's not there.

1444. Re: Amadeus

Newsgroup: comp.sys.atari.st
Date: 1995-04-25 00:00:00 UTC
From: efac001@alpha.qmw.ac.uk
Message-ID: <3nip12$c6a@epsilon.qmw.ac.uk>
Source record: 166910

Stephen Atty (satty@cix.compulink.co.uk) wrote:
: Looks like there are two products both called Amadeus. There is the
: commercial product and then there is the one at HENSA.
: The one at HENSA is (according to the filelist) "Amadeus the Great (Command
: Line) composer 1.0"
: What this is or does I have no idea - can Danny help us out on this one

Thank you Steve, for the compliment in the other message...

The Amadeus at HENSA is not the music score writing package that was
originally asked for...here is a small description:

==========
Bored of always typing in a tortuous command line in order to carry
out a seemingly simple task?
i.e. cc myprog.c -lgem -mc68030 -o myprog.prg

Or for fans of the internet:
lzh -x -r archive.lzh d:\in_here\

AMADEUS.TTP is the answer!

All you need to do is edit the INF file to your set up, install the
application, and away you go.

Then, all you need to do, is click on an icon (such as, .lzh, or .c),
and the particular action will be performed on them. The INF file
contains a list of commands for a particular action in a particular
program. So if you click on a .lzh file, then it will be unpacked. If
you press the right mouse button while clicking on the file, then you
may view the contents of the file.
==========

It is a very powerful progam....

> While things seem to work, at the immediate time being,
>this is an even "worse" computer than my Apple //e, 800xl, CoCo3,

The 520ST is a 512K ram with 8MHz 68000 computer vs your 128K ram, 1Mz 6809 Apple //e (or did you use a 3Mhz accelerator card ?). So which do you think is better?

>and Commodore plus/4 (all but the first I never use...) mainly
>because I have no software to boot up...all I can do right now is

Most ST have the OS on ROM, unless you bought a very very old version (but for under $15 what would you expect?). You can boot up and have GEM running without any disk in the drive. There should be a A: drive when you boot up and should be in low-res mode (assuming you use a TV).

> Is there any kind of built in self test?

Unfortunately not the old ROMs. The newer ROM does.

> What kind of drive is the SF314? DD? HD?

Dunno. Most ST have builtin 3.5in double sided DD drive, unless again it the earliest model. All ST drive are DD unless some hardware modification is done on the motherboard so I am sure yours is DD. However, it could be either single or double sided.

> What kind of boffo cool stuff can this puppy do? (and
>where do I get started?)

Try the ftp site atari.archive.umich.edu or
http://micros.hensa.ac.uk/micros/atari.html for some Atari goodies.
(note micros.hensa.ac.uk only opens it's door after 8pm GMT, i think).

I suggest you get a system info program like SINF_220.LZH which will tell you something about the hardware of your ST. Then some demos just to see the graphics and sound capabilities. You may want to download the index file of the ftp site for atari programs, just to see what software are there. Have fun.

The problem you may face is to transfer file from your internet access computer to the ST. Does the 5.25 drive work? If it does then you can format a 360K 5.25 on an IBM PC and transfer file with that disk. Format on the PC, not the ST.

> Where does the 520 stand among the ST computers? (and
>what does "ST" stand for anyway? =^)

ST = 16/32 -- something to do with the bus and CPU.

HTH.

That's not surprising at all, really. Sounds about right.

Larger drives, especially the newer ones, almost always have faster
average access times than do similar yet smaller capacity drives.

What is there to misunderstand? You called Atari developers stupid.

> Unlike others i don't try answer for other people.

Unlike others I don't stereotype people and I avoid insulting them.

>If there isn't a market for Falcon software, then give me one good
>reason for saying there is a market for ST/TT software ?

I never said there is NO market for Falcon [specific] softare. My claim
is that there is a -larger- market for ST/TT software than there is for
Falcon-specific software. For some reason (gut feeling? voodoo?), you
seem convinced that there is a larger installed user base of Falcons out
there than the older ST/STe/TT machines. I disagree, and base my opinion
on the percentage of recorded sales to and warranty registration cards
received from users of both camps (data from myself and other IAAD
members). The older units far outnumber the F030. Facts, not conjecture.

>>> I'll get my PC one of these days.
>>
>>I wish you would quit threatening us and just DO IT!

>So now i'm threatening you Hutch ? In what way ?

In the same way that our old friend Roger does (two peas in a pod?).
You both keep telling us how you are going to buy a PC some day and be
done with the Atari because of this or that complaint. Sorry, but that
sounds a lot like a threat from a little kid who didn't get his way.

>You don't give a damn in anyway, so why do you feel a threat.

Wrong again. If I didn't care I would just ignore your incessant
ramblings. Oh, only that I -could- just ignore you. What bliss. ;-)

Source record: 166921

Simon Moore (smoore@chowgar.demon.co.uk) wrote:
: Does anybody know of a program that can view CGM (computer graphics metafile)
: format ?

I may not be completely correct on this, but CGM is a form (probably a
superset) of GEM metafiles. I once tried importing a GEM metafile from
EasyDraw) into WordPerfect on a PC, and to my surprise it worked.
WordPerfect thought it was a CGM file, but hey...

So, a possible answer to your problem may be to use a GEM drawing program
such as Kandinsky. GEMview handles GEM metafiles as well.

Substation

Storyline
In 1996, Mitushi Industries, a small Japanese industrial group, is researching alternative energy sources. What they come up with is so unbelievable it might just be possible.

Three years later, Mitushi's 'IEE' (Inside Earth Energy) base Substation at 2500 metres below sea-level provides Japan's two largest cities with all their power needs.

June 6th 2004, 11.15am: Contact with Substation is lost. In panic, Mitushi's Board of Directors pay the U.S. government an unknown amount of money to lease an 'M.E.M' (Multi-Environment Marine) to find out what has happened.

Visuals
SubStation is an incredible action game in which the player moves freely in an extremelyfast real-time gouraud-shaded 3D world. The screen refresh rate for the 3D world alone is an amazing 25fps (frames per second) in a resolution of 320*160 using 3 bitplanes.

The 3D system is a state of the art development solution written by Mikael Emtinger and Oskar Burman, and will make Substation one of the most technically advanced games ever to appear on the STE or Falcon.

Gameplay
Substation runs on any Atari STE 1Mb or Falcon with RGB or VGA monitor. Your cha
racter is controlled either using the keyboard or Jaguar PowerPad. You can run, walk, strafe, pick up items, choose between a great number of weapons, open doors, access elevators between the different sublevels and even strafe, rotate, run and fire your gun at the same time, giving you total control of your actions!

DD Audio
To further increase the horrifying atmosphere in Substation, Tord Jansson (responsible for the amazing sound routines in Obsession) developed a special sound effect system called DD Audio (Distance & Direction) which enables you to hear where monsters are lurking. The combined effect of foggy colours and pit-pat of tiny monster feet from the far left will give you nightmares....

MIDI-Link
By utilizing the link capabilities of Substation, you can play against other humans in special combat levels using the MIDI ports. Up to four players can take part in a game, either by forming two teams, or every man for himself... In MIDI-Link Mode you gain credits for which you can buy extra ammo, first-aid kits, food or new weaponry.

Scheduled Release Date : May 1st 1995
Price : 24.95GBP (UK)
26.95GBP (Europe)
29.95GBP (Rest of the World)

Available from : MERLIN
PO Box 77
Stroud
Glos
GL6 9YD
U.K.
Telephone : 01452 770133
Fax: 01452 770133

or EMAIL orders : POPEMERLIN@DELPHI.COM
Credit Cards only. Cheques/Cash/Postal Orders must be sent.
All Payment must be in Sterling.

Hope this helps.
Sorry for the mistake in the setting halfway through but the 80 character thing gets a bit confusing.

>Unfortunately there is no automatic demo, documentation or email
>address so I don't know what more I get after paying the 25 pounds
>sterling for the full version. I'm tempted.

Hi,

We sell Zero-5 and can tell you that you get a great deal more for your
27.95GBP (extra postage to Denmark) and take credit cards.

Zero - 5 ,the full version, has over 15 missions with more on their way.
It also includes the option to have your own picture digitised into the game
and used as your pilot's picture.

The game is great fun and plays for a long time.

If you do want to order it, you can email us your details to POPEMERLIN@DEL
PHI.COM.

We will send it out the same day as the order is received.

The Lightning 730 is a great drive. Fast. And the Parity-Jumper does work on
this one, unlike some of the smaller drives, e. g. LPS270/540S.

Quite right. But the number of ST/STe/Mega/MSTe/TTs still in use is larger
than the number of Falcons out there. And _that_ counts.

There are many things that could make them appear to be slower. People
here can tell you how close they have managed to get their scsi drives
to the maximum stated throughput rates and then you might have a rough
gauge as to the truth or falsehood of the question.

>>monitor.

Placing the monitor between your speakers can damage the monitor permanently as stated previously, it also may be the source of your line noise. Where is your monitor cable running ? Keep these things as far apart as possible.

As far as the line noise goes, search out the source of the noise itself. Quiet often it is only compounded by the computer. If you have rack gear, isolate all pieces. Wooden rails are the best solution but there are alternatives.

I guarantee that your computer is not magically creating noise in all your gear. More likely that one piece is not happy with the ground of some other piece and the Atari was the last straw. These grounding problems start often in the MIDI flow and then travel thru the rack rails.

Nylon washers and screws are a good alternative to wooden rails and make sure the rack cases are not touching. Good luck.

: BZZZT. First off, the PC first came out in 1981. Second, I could say that the
: Falcon is 80's technology. Third, the PowerMac has hundreds of native apps
: that will leave the Falcon at the starting gate. Fourth, the Falcon's
: installed base is less than the Jag, so how can you say that people love it.

Oh, boy! Are you trying to say that people don't love Rolls Royces, or
Ferraris because there are more Fords on the road ;-) ..?

This is getting better all the time !

: Whats an Eagle?-> You see the public does not know or care. Where can I touch
: an Eagle? The Medusa 060 is not available to me down the street and would
: exceed the cost of a PowerMac 8100!

Are you the people who don't know, nor care?
Many people here know quite well, and even more want to know more =-) !

: > : Mac OS is fine whats wrong with your?
: >
: Really, My OS blazes whats wrong with yours? GEM is a pathetic joke. Has the
: look and feel of GEOS on the C64. My OS is plenty of stable with extensions and
: performs well at file sharing something you cant do with your GEOS OS with
: ease!

Your words confuse me: first something is wrong with mine.. My what?
And the next moment your OS blazes what is wrong with mine - again. Very
interesting, indeed! Do you mean: what is wrong with _my_ operating
system? Only the doctors can tell that. But you must be right: MacOS
really affects my brain. It sometimes creates me a strange desire to get
me a sledgehammer, and a twelvepack of beer... Very strange.

GEM is a pathetic joke, isn't it? Bravo! That's the first time ever I
hear such a comment. But if your words are true, then GEOS must be pretty
nice ;-)

: Know but advocating a dead platform is dead wrong. So how is Mosaic and
: Netscape on the Falcon?

How will Mac be in the future? Some people in the industry forecast Apple
very hard times.. Even "death". Those people may be wrong, but... You
never know. Besides, I'm glad you're not my doctor. You'd put me into
grave alive without a second thought. You know, nobody would sacrifice
lots of money and effort to build Atari-clones in Germany, if this was a
"dead platform", would they? You should know the Germans better...
They're stone-hard business people. If they think Atari-compatibles have

a future, I'm not the first one to say they're wrong.

: > Just for curiosity: why do you still hang around in Atari areas, when you

: >Has anybody got an RGB and a VGA monitor hooked up to their Falcon ?

It might be better to get a NEC Multisync monitor, capable of both RGB
and VGA displays. Or Commodore's Multisync for Amigas. Too many monitors
= too much hassle =-(. It's not difficult to make a switch box, or even
to build a RGB/VGA switch into Atari's own VGA adapter. The German
(great!) magazine ST-Computer published the instructions some time ago.
Maybe someone can post them here, too?

Just be CAREFUL... It's not difficult to build a Falcon-monitor adapter
yourself, but one has to build it exactly right. One wrong joint, and
BANG! If you're unlucky..

Greetings,
Tommi

1475. 32 MHz for Falcon ?

Newsgroup: comp.sys.atari.st
Date: 1995-04-25 00:00:00 UTC
From: gs01tph@panther.Gsu.EDU
Message-ID: <3ni9ae$99i@sphinx.Gsu.EDU>
Source record: 166941

How do those cheap Falcon accelerators work? I think I heard someone mention that it's possible to get the 32 MHz frequency rather easily from Falcon's motherboard. Is is possible, anyway, to make a similar accelerator as "Power-Up", etc. at home ..?

Can anyone give exact instructions?

What about PAK 68/3 on Falcon ?

It would also be very useful to raise the bus speed to 18 or 20 MHz. Some accelerators do this - but how..? Any chance to do it yourself?

Thanks for info/help !

TH

1476. Jekyll on Falcon ?

My guess is that it wont work on the TT as it'll use the BLiTTER.

Also, PLEASE stop calling it a Doom clone. It is nothing like Doom, in that it uses a completely different way of drawing - shaded, but not T-mapped. The gamplay element may be similar, but the word "clone" implies that it looks similar as well...

<Rant mode off>

STF said that there was not going to be a Falcon only version. Anyone know if this is true?

See ya

yes, the demo is in German; hopefully someone at System
Solutions will release an English demo of it. The program available
now from SS is fully in English.

And yes, it does require System 7 - it also requires a minimum
of 8 megabytes RAM, 350 mB hard drive, and a 68030 processor on a
Macintosh.

BTW, wouldn't it be easier just to run the Atari version of
MagiC on your computer :). You ARE running an Atari, aren't you?

I'm with Hutch on this one - first hard drive I ever owned was a 30MB one
from Technomatic which plugged into the 1MHz bus on the Beeb. It had a Seagate
mechanism and came with a free game called "Will the drive start this morning?"
Not an awful lot of fun really - especially if you hadn't backed up in the
last month (but then again, only a fool wouldn't make regular backups :)

Incidentally, 5 of the 6 hard drives distributed round the flat (30MB-420MB)
are Connor or Quantum mechanisms (the sixth is in the A4 and we haven't
the guts to start dismantling portables) and we've had no problems at all
except for a slightly noisy fan on my MiniS which SS say they'll fix if I
bring it in - except if I did that, I'd really need to back the drive up
and I can't afford any more SyQuest carts right now.

1482. SDS

Newsgroup: comp.sys.atari.st
Date: 1995-04-25 00:00:00 UTC
From: jon@powerslv.demon.co.uk
Message-ID: <19950425.165716.35@powerslv.demon.co.uk>
Source record: 166948
Cross-posted to: comp.sys.atari.st,comp.music

Can anybody point me to an SDS FAQ or answer a couple of queries I've got. I've been trying to hack out the format from the raw dumps and a couple of mentions made in old back issues of SoS but I've as yet been unable to work out the following:

How is the 7bit encoding done - I've not yet found out how this works, tho' I've tried a few possibilities.

How is the packet checksum calculated (CRC? Adds mod 256?)

How does the data in the first packet (apparently header and format rather than sample) work - what's there and how's it encoded.

I'm asking because I'm currently in the middle of writing an S01 companion and while Akai were very helpful (thanks go out to all at Haslemere) in providing S01 (& S1000) sysex specs, the IMA want money for the SDS specs (technically MIDI v1.0 r3.3) and I'd rather not fork out if I can avoid it.

TIA for your time, bandwidth and disk space.

>
> And if Calamus SL on a Falcon030 is that good, the world should know!

Personally, I'd find this easy to believe - the OS overheads imposed by TOS &
GEM are way lower than those of either S7 or (esp.) Windoze. I haven't seen
VP5 yet but if it's running at a speed even comparable to old versions
running under DOS/GEM without needing vastly more powerful hardware then Corel
must be related to some deity.

ObRidiculousPower: for Ventura-esque DTP (ie books, theses etc) at REAL speed
try FrameMaker running on an fast SparcStation.
Unfortunately, I left that lab, but the memory still
lingers.

Yup - Cubase Audio and a Yamaha CBX-D5. Gonna cost you serious bucks tho' -
the CBX-D5 is a very sexy and very expensive (and very late :) standalone
D2D recorder with, AFAIR, the equivalent of 2 SPX900s thrown in (to help
justify the price?) and all the fancy tricks you could want to perform in
the digital domain at your (virtual) fingertips.

My guess is that it wont work on the TT as it'll use the BLiTTER.

Also, PLEASE stop calling it a Doom clone. It is nothing like Doom, in that it uses a completely different way of drawing - shaded, but not T-mapped. The gamplay element may be similar, but the word "clone" implies that it looks similar as well...

<Rant mode off>

STF said that there was not going to be a Falcon only version. Anyone know if this is true?

See ya

1486. Re: scsi on falcon

Newsgroup: comp.sys.atari.st
Date: 1995-04-25 00:00:00 UTC
From: jack@aurora.carleton.ca
Message-ID: <D7KzoD.H79@cunews.carleton.ca>
Source record: 166994

For those interested in SCSI performance on a Falcon:
I have two SCSI drives: a 120 MB Quantum (1992) and a 540 Seagate (1994).
Using the german program 'How Fast' I got a maximum transfer rate of
1.8MB/s on the Seagate (with 1MB+ files) and 1.2 MB/s on the Quantum.
The newer Seagate also performed much better with smaller files propably
due to the faster seek times.

The only problem seems to be that I can't copy files bigger than 4MB
as I get device not recieving data errors. Is this a problem with the OS
copy routines? I've heard that this problem might be solved with Kobold
though as I only have the demo version I cannot test this out.
Has anyone else had this problem and/or found a fix?

(the problem persists even in 640x200x2 on an RGB monitor.)
Everything seems to work OK with the IDE drive though...

Just my words :-)

I have exactly the same exsperience. Falcon owners (and some TT owners) I know, are
the ones whos actually interested in buying new hard&software for their machines.
Personally I also bought PINBALL DREAMS (great pinball) and in addition I've bought ISHAR,
ISHAR III (extremely nice graphics), LLAMAZAP and STARDUST (a winner!).
And I think I`m going to buy SUBSTATION (even though it's only an STe game) and
OBSESSION-Falcon version (when it's finished).
Other Falcon-owners that I'm frequently talking to also bought some games and some
productivity software.
We Falcon-owners bought Falcons to _upgrade_ and use enhanced (and faster) software
and hardware, and therefore we're also trying to support it by buying the things we find
interesting.
I also know some ST owners, and they`re absolutely 'boring` to say it least, they
are definitly not the ones that are buying new things, they mostly try to get a copy
of some software somewhere. And they're not ones whos supplying any new "waves" in our
local computerclub.
Actually the Falcon-owners work quite close with PC and AMIGA owners in the club, because
the Falcon-owners kind of feel more aquinted with the other modern users.

We often exchange graphics, 8, 12 or 16 channel music modules, programming exsperience etc.etc. And yes, CD-rom on Atari is definitly Falcon! :-)

Keep Cool and Flying...

why did you insist on having such a slow 486? at least you should get
a 486dx2/66. and 8mb ram of course. Windows is slow indeed. I HATE
windows.

:
:Try Linux :-)

indeed. prepare to get more ram as the 8 you probably have(at most) is
only just enough.
Linux with 4Mb is as slow as Windows, I guess, certainly on such a sluggish
486 as you have.

I've never used it myself however I suspect that if the version you had
didn't take advantage of the 030 or FPU then it wouldn't benefit from
being run on a Falcon.

Oh Contraire... there is a greater population of ST/TT machines than
anything else. If MagiC is as smart a marketer as they should be, go for
the largest segment of machines first. Get some sales, then continue
development for other segments of the market. They are just being smart
about things.. Give them some credit... Falcon development will take
place as funds permit.. who knows, and advance order on your part might
even speed things up.

Depends which 320s really Ole. The TMS320C80 is a monster of a DSP!
What number comes after the TMS320? Some of them are floating point, probably
significantly more powerful than a 56001 (though I've never used the TI
range of DSPs, I went to a TI seminar where they showed them all off)

These are Peltier effect devices. In fact one side gets hot and the
other side gets cold. (you can't do one without the other at constant
pressure! Where would the energy go?)

It would be possible to do this, and I've seen it done before on a
large ASIC that got hot. But they're quite expensive for the big ones, much
more than a small fan. The problem remains, as I mentioned previously, that
the part you want to cool is the part that is most susceptible to a rise
in temperature, and without knowing that (only the designers would have any
idea) you don't know which part to cool. The CPU may be fine even when a lot
hotter than it normally runs. Some other chip may die at 100 degrees. Who
knows?
Leave the fan!

> Mainly concerned about any taxes, and likely shipping costs.

I think A$450 would be a little steep, even considering Australia's high
import taxes and all that rubbish. Shipping wouldn't be that much (<$20)
but you would be much better off to ask your own Australia Post about
the tax/duty situation as no one in the US would have any idea on that.

Considering these things are selling like hotcakes to Mac owners, why
not check around some Mac dealers down there to see what they reckon?

1502. Re: HSMODEM and MiNT, how?

Newsgroup: comp.sys.atari.st
Date: 1995-04-26 00:00:00 UTC
From: dsb@cs.duke.edu
Message-ID: <3nm88e$lvq@duke.cs.duke.edu>
Source record: 166760

From the Holy Book of <avg.798895015@news.cwi.nl>
as spake by avg@cwi.nl (Annius Groenink) :

>I recently succeeded in getting MiNTnet and a SLIP line to my
>UNIX box running! (finally, after 6 months or so... :-)

Welcome. I just set up MiNTnet myself (though without as much
difficulty), and am working on an X setup.

>Now I would like to get 115200bps from my TT's Serial 2 port
>rather than the poor 19200 I am currently running SLIP on;
>otherwise using the TT as an X terminal will be annoyingly
>slow.
>
>I tried HSMODEM, and it works fine on plain TOS; but with
>MiNT there is a problem; run the patches before MiNT, and
>MiNT throws them out;

Are you sure about this? That's exactly where all of the MiNTnet
documentation indicates HSMODEM should be.

I'm inclined to believe that the conflict is not between HSMODEM and
MiNT, but HSMODEM and the TT. I know I've been having a fair amount of
trouble with HSMODEM on my new TT, running the same version as on my
MSTe, under the same MiNT version (1.12 bog standard).

>(by the way, can someone do something about this behaviour?
> it is _so_ immensely dense---I mean even a row of bombs
> is more informative, and it doesn't require you to press
> a key before you realize that you need to reboot)

I agree that a more informative error message would be helpful, but I
suspect that at the low level at which this is happening, even MiNT is
having difficulty figuring out exactly what went wrong.

>Shouldn't the HSMODEM patches be included in MiNT, together
>with a flag that enables the high speeds, much like what
>Linux does?

Are the HSMODEM sources available? If so, I'll get right on it.

>If someone is reading this far, would anybody know where
>to get 'xhost'? Running X on my 6 meg TT is fine, except
>that the second x terminal runs out of memory... Running
>plain X and doing the rest from my Linux/486 would be very
>nice, but without an access control utility I don't get
>very far... (connection to X display refused).

Get phlem.ph.kcl.ac.uk:/pub/atari/MiNT/X11/Clients/clients2.tgz. It
should be in there.

: Kevin W. Dolorico (kwd9152@is2.nyu.edu) wrote:

: : once again time to upgrade. All instincts were pointing towards the
: : Falcon...

: : ...but logic told me that the 030 was outdated already... and the PPC was
: : the future of non-Intel-compatible based computers out there. If I

: What does it matter, if 030 is outdated - if it works? As most people
: admit (those, who have used both Ataris, Macs and PCs), Atari OS doesn't
: require nearly as much horsepower as Mac's System 7.x or PC's Windows
: does. You can use Calamus SL on a 8 MHz, 4 Mb ST quite well (I know,
: becouse at my home university the school magazine is done like that..).
: But try the same on Mac Plus, PageMaker and System 7? No hope. Or
: PageMaker on a 386-16MHz/4Mb? Ridiculously slow.

: I just can't understand, why so many people out there just look at some
: _numbers_ ("030 is outdated, so Falcon is too..) instead of the true
: performance of the system... My Falcon runs Calamus SL as fast as any
: 486 PC runs PM or Ventura - or a 68040 Mac runs whatever publishing
: software. This is no surprise to TT-users, who know it's true. Neither is
: it any surprise to Falcon-owners. TOS is superior in speed compared to
: System 7. So, what does it help if you get a faster computer - if a
: heavy operating system makes your software run just as fast or slowly as
: before? Macs file operations, e.g. are hopelessly slow compared to a
: simple 520ST with TOS 1.4.

: : My ultimate decision was to get the PowerMac 6100/66/DOS compatible
: : package. I worked in a Mac-based computer lab for a semester, and
: : learned a lot about Macs. They offered more ease of use than the
: : PC(obviously) and actually, even more than the ST! Everything about the
: : Mac feels professional. It didn't feel like playing with a toy. I

: Here I must strongly disagree. The more I've used Macs, the less I like
: them. As most people tend to think that I'm the one of us who's biased,
: I'll have to tell you, why:

: I like to have control over my computer and its programs. Mac "thinks" a
: lot for its user; does lots of things without warning you, or at least
: without giving you much or any alternatives. Those decisions Mac does,
: aren't always, or even very often the ones I'd have done myself. Is Mac
: smarter than me, then? Maybe. Some of you may think so. I blame the
: extreme simplifying of everything; it makes a computer easy to use, but
: at the same time limits you. I'm happy that you like System 7 - but for
: my taste it's far too slow and limiting. It has its nice sides, too -

: can't argue that!

: Despite that some of you never understand what I mean (because you think
: in other way, and have different ideas of using computer), I too often
: find myself cursing: "this machine is STUPID!!!". Well, sometimes I'm
: that too (who isn't?) - but honestly, I haven't got that feeling ever
: using TT, Falcon, or other Atari models.

: I hope you understand this point of view, instead of thinking that I just
: love to be biased and nasty towards you Mac-users =-). I don't. There
: are some people around who think that "now, when Atari is dead, we all
: should upgrade to the next, logical alternative: Mac!". Those people seem
: to think that it's only natural to like Mac at least as much as one liked
: his or hers Atari. Everybody loves Mac, some people think! And if
: somebody doesn't like it, he's a bit dim, envious, or just queer ;-) !
: That all is nonsense. We speak of two very different computers. Mac is
: better than Atari in many aspects. But so is Atari better than Mac in as
: many. Neither is superior to another as whole. I think, everybody should
: use whatever one loves to use. Especially, when Atari community is quite
: far from dead... There are lots of great programs available, CD-ROMs,
: etc. What else do we need? Pentium-Falcon for power freaks ?

: : finally can view pictures in MORE than 256 colors(on my ST...well, it
: : took hours viewing gifs, and days viewing JPGS) :)... Ah, glorious
: : color. :)

: Falcon isn't bad at that, either. With DSP especially JPEG-pictures load
: in seconds. I don't think it's fair to compare ST and 6100 today ;-) ?

: : 16-bit audio with sampling facilities built in doesn't hurt either.
: : I know... in order to run more powerful applications, you need more ram.
: : Well... a lot of the software I now use is really a lot more powerful!
: : I couldn't even imagine a Photoshop equivalent running on the ST/TT. I
: : guess it could be possible on the Falcon, but not on anything else w/o
: : expensive non-standard graphics cards.

: I guess you haven't used Chagall, DA's Picture, or Calamus SL lately? And
: where are Mac-equivalents to Selectric, E-Copy, STalker, or Apex Media?

: : Only the diehard hackers and wanna-be hackers are still using the STs.
: : :) Perhaps there are also some musicians who don't know any better using
: : their STs. :)

: Aren't you a bit *too* proud of your PowerMac ;-) ? I'm glad that you're
: so satisfied with your computer. But so am I with mine; I guess neither
: of us would exchange computers with each other. And why should we?
: Well, I'm not a musician (at least, not now) - and wouldn't consider
: myself as a hacker, either. And I don't think you use a "better"
: computer ! Just different, and a good one.

: : Well... I don't know if Atari is working on any new hardware, but I
: : definitely think they should consider developing a new version of TOS
: : that would work on the upcoming PowerPC multiOS-platform that

: : Motorola/IBM/Apple have been collaborating on to combat Intel's
: : monarchy(Anarchy, imho)...

: Not a bad idea.

: : I don't know if I made a point or not, but just remember that if you're
: : on an ST with under a meg and without a hard drive, you're really missing
: : out on a lot!... you're simply not... INTERNET capable. :)

: You're right! That's why the solution is... Falcon ;-) !

: : One last thing... you need CUSeeMe. Video Conferencing over the
: : internet... and it can't be done with an ST. Low end machines simply
: : don't have the power.

: And most Macs don't have a DSP, nor a Blitter.

: : Basically... if you're running on a 68000 processor, really, it's time to
: : upgrade(unless you're just doing Midi). :) For under $1000, you could
: : own a Performa 475, based on an 040... you'd need to spend another $320
: : for a total of 12 megs of ram, though...

: Please! I enjoy using Falcon - and get frustrated using Macs. So, unless
: I'm stupid and biased person, there's no point in changing your living
: workhorse. And when you do, the best alternative for most Atarians might
: be Falcon. It's as fun as an ST, but much more powerful.

: : For around the same price, you could get a decent 486/66 system if you
: : want to choose the harder route of adjusting. Of course you could still
: : take all your old software with you if you buy the GEMulator.

: That sounds already pretty desperate. PC is good for gaming, but... Well,
: I won't say more !

: : Don't fight the funk. Walk away... and that's my word for today.

: ...And after a second thought: why not stay ?
: You might face a brighter day !
: ;-)

: Greetings,

: TH
Whoa... to each his own... If I get a bigger stick, does that mean that I
should be unhappy because the kid next door gets a bigger stick... I
think not, I should just be happy to be happy, discontent is not part of
my belief system.

I have an Atari 1040ST with color monitor available for sale. System is in perfect working order and has had very little use over the years. It comes with a small OKIMATE Color printer, ribbons, paper. I still have the original boxes and manuals. I have no software or hard drive. If you are interested, I'll take the highest offer received by 15 May, payment to be made by Cashiers check, COD, or money order. Offer must include estimated shipping from Orlando, Florida to your location. This is a great offer if you want the system. Everything is in like new condition.

If the Atari sections on HENSA are shutdown, will the archives be
transferred to another system?

Perhaps the lack of usership on the Atari sections are due to the
time restrictions that (I'm not sure about now) were imposed.

I find it difficult to get on to Hensa, even with a browser.

The user needs at least TOS 1.04 to format and correctly
read DOS compatible disks.

Otherwise, I believe UISIII provides a way to format a DOS disk.
But it may not allow you to read it back.

Source record: 166769

Hi all:

As a former ST and Falcon owner for many years I'm well aware of most
of the differences between ST and MS-DOS disk formats.

However, I'm not sure about one thing:

I remember reading somewhere (one of the Abacus books?) that the ST
uses 5 sectors per a FAT while MS-DOS uses 2 sectors per a FAT.
It is because of this difference that some ST disks even with MS-DOS
boot sectors have trouble being recognized by some PCs.

Is this correct?

Please direct all replies to my e-mail address as I don't get to read
this group as often as I'd like. Thanx in advance.

> --Lunatic

>: Ben van Mil

>: VanMil@Mindlink.bc.ca

To which Ben writes:

I have a Medium tower case for my 1040 STF external hardware which includes the A and B floppy (the A drive from the case), two hard drives that I have mounted, the Host adapter and the connectors on the back of the case for Serial and parallel outputs, I as of yet do not have a CD-Rom but that may not be to far off. On top of the case I have a External 14.400 Fax/Modem as I prefer to see the lights move.

Just a few details on the Case itself, really to job is not that bad to do although it looks rater major, just in short, ALL the ST hardware except the keyboard are inside the case, I took the case of the ST and cut it along the groove just above the F-keys, and repeated this on the bottom section, this gives me the freedom of moving the keyboard anywhere on my desk without the mass of cables on the back of the standard ST case. I really suggest you do this, it is not that much more work and it really adds to the job !!!!!

These are the things to look (out) for,

- The case you should look for has to be a medium case, 19"High x 16"Deep x 8.75"Wide, this case is NOT the standard Med. case, the case to look for should have the extra 2" next to the 5 1/4 drive bays, this is important because this is where the ST Motherboard is going to sit. The 16" deep is important because to make it easy on the installation you can keep the ST output connectors on the inside of the case rather then making extensive cutting work on the rear of the case, after this you can just bring the Par. en Ser. connectors to the rear of the case, all except for the monitor cables stay on the inside!

- I use the PC power supply for the Power feed to the ST motherboard and all the other hardware, this works just fine!

- My case has 4 removable drive-bay covers and 2 fixed locations for a total of 6 place to mount equipment.

- I wired the Reset switch from the rear of the st to one of the momentary pushbuttons you can find on the front of the Tower case, this is so that you reset the ST with out having to search for the little button.

- The SCSI link runs from the Host adaptor to each of the 2 Hard drive and in your case to the CD-Rom and the Tape backup.

- As said before I cut my ST case to a reduced size and extended the cable between the keyboard and the ST Motherboard by a additional 30", this takes a bit of soldering but works fine, and it is cheaper then getting the ST kit for this, and it works the same, and almost looks the same too, you retain the Power light and drive A light normally found on the ST case.

- The other hardware I have mounted in the Tower is the Ram expansion board (lots of room) and the PC-Speed board for Emulation of a PC, again, lots of room!!!!

I think I did the whole job for around $150.- This is for some hardware, cables and some connectors, one tricky part came in where I had to remove and replace with a longer cable the soldered connection to the ST Motherboard for the A drive, if you do not simply extend this cable to a extension it requires a brave person the Un-solder the fixed connector from the ST Motherboard.

Anyway, these are a few pointers to the conversion of the Standard ST case to a ST-Tower case, it may take a bit of work but you will like the results!!!!!!!!!!!!!

Email me if you have questions.

Ben Van Mil.

1514. MSTE {16 Mhz} 4 Meg Ram FS

Newsgroup: comp.sys.atari.st
Date: 1995-04-26 00:00:00 UTC
From: mayolc@ucunix.san.uc.edu
Message-ID: <3nm9vi$hvv@ucunix.san.uc.edu>
Source record: 166772

For sale:

Atari Mega STE with 4 Meg of Ram for $399, and you pay shipping.

Also for Sale is a Cannon BJ 10ex inkjet Printer, that prints at 360x360 Dpi for $150

Zoom Vfdx 2400 Modem with Fax class 1 & 2, Caller ID and VOice Mail $59 including STalker 3 comm software.

And finally an External Floptical drive with 5 Disk [of 21 Meg each, some loaded with lots of software] external supply and ICD Link and cable [a plug an go unit], it also reads HD disks, for $199.

Migraph Hand Scanner with Touch up and OCR Jr. software $69

Nova VME plus 16.7 Million colors card with True Paint, and Prism Paint 2 will sell for $300. Also a 15" Monitor SVGA low radiation up unlimited number of colors Multiscan Compudyne for $250 [practically new]

For any of the item above you pay the shipping. All items will sell in box with manual etc.

Interested? Mail me at mayolc@ucunix.san.uc.edu

Message-ID: <8A82374.00AD002553.uuout@genesis8.frmug.fr.net>
Source record: 166781

Greetings from sunny Corbarieu, Michael!

YES, I'm a user interested in /Power without the Price/ concept hardware for the Falcon. An accelerator in that catagory would be interesting, as would many other pieces of hardware.

The thing is, how can small-time developers come up with low prices if they have no hope of high volume sales. Does anyone out there really believe that Ataris will _ever_ again be sold in the same numbers as in the 80s? The market has changed a great deal. Many, if not most kids are going through school exposed to a PC environment. Do you expect them to suddenly switch platforms to a machine that has basically no decent marketing, no service, and only confidential software development?

If I remember correctly, the resin tree is located at the end of a canyon in the Southwest corner of environment 1, south of the entrance to environment 2. Where did you get the egg and feathers from? To make a bow, all yyou need are some branches and string.

JR>Why would anyone with Atari hardware buy a drive with a *parallel*
JR>interface?

I think it wouldn't even work because of the missing handshaking lines
of the Atari ST printer port. Most of the PC printer port devices use
the handshaking lines instead of bidirectional data lines because there
aren't many cards w/ bidirectional D0-D7.

LiNUX doesn't run on the ST/STE. Only machines with a 68030 CPU with 68882 FPU
or better (ie. Falcon/TT/Medusa/Eagle).
If your ST has a 68030 card installed with FPU, it should run though.

You can ftp it from `ftp.cnam.fr`, I don't know if all files are there, but
there are at least some.

Keep Cool and Flying...

IMHO, it is realiable.
I have used the solderless Eversham 4Meg upgrade for years now. My 520ST
motherboard uses a surface mount MMU and Eversham provided a adapter (an
inverted socket) for that.

> Is this group dead? Are there no more atari programmers?

Nah, it's just that the need/utility of a group such as this one was over estimated, IMHO. Most programming questions are -still- being posted in comp.sys.atari.st.tech even though they belong here. There just isn't enough traffic to justify both groups, IMHO.

> Basically the question is What is Magic Mac ? I have NO clue

It makes many Atari program run on a Macintosh (currently, only on Macs with a 68030 or 68040 CPU -- not on PowerMacs yet). Generally, programs that run under MagiC on an Atari and that do not access hardware registers directly (like the sound chip or the MFP) will run with MagiCMac on the Macintosh - at the full CPU speed of the Mac's CPU.

German version comes from Application Systems Heidelberg, in the UK it is distributed by Computer Systems (those who also sell NVDI).

You're right!

>before ,but what do I need (progam name) to unarchive *.tgz (TAR ZIP?) files ?

That's tared and then zipped, but by using gzip not the normal zip. I think they may be the same but I don't know. I heard that Gzip gives slightly better compression than Zip.

>Also if its a TTP the most common paramters to pass to it to get a standard
>uncompress to the source directory would help.

To uncompress use: gzip -d filename.tgz
Then use tar to untar it: tar xvf filename

RS> I think the problem is that Atari users have been spoilt with a
RS> simple computer, and now find it to hard to upgrade to a Real PC....
RS> To the average Atari user PC clones are to hard for them....!!!

To put it plainly 'Bollox' Roger. I use the Falcon at home and the 486 DX at work, and both are good machines. I can do things on the Falcon I can't do on the PC and vise versa.

The Falcon can easilly beat the PC of graphics manipulation using Apex Media, and the PC can beat the Falcon on communications (once set up correctly).

The PC's at work suffer from incompatabilities between hardware/software, the the net used quite often fails occasionally. The Falcon has never let me down yet, and it all links together perfectly.

Basically it's horses for courses, you've now a confirmed PC type guy, and I'm willing to live on the edge with my Falcon. You are happy that way, so am I. Therefore why not leave off slagging off Atarians and go join some PC newsgroups.

It seems to me that you just stay around in this group to spout off and annoy people.

Sorry I had to write the above Roger, but I'm sick to death of you winding me (and I suspect others) up.

Seems like you have a lot of questions, to say that the Computer is capable of absolutly Nothing is maybe being a bit to negative towards the little animal.
However if you want to run Linux it may be time that you need to do a bit more homework as I doubt if this little puppy can preform the task you ask from it.

Question, Why Linux ?????

BVM.

1545. Re: Recovering data from floppy on ST

From: VanMil@mindlink.bc.ca
Message-ID: <69637-798963794@mindlink.bc.ca>
Source record: 166814

Like many other Computer formats the ST has a series of Un-delete utilities, they however only work if the disk has not been writen to yet after the files you want to recover have been deleted, to write to a disk would destroy the information you are trying to recover!!

To do this one simply Un-deletes or Recovers files from a menu, and thats it!

Let me know if you need help finding one of these programs!

One thing you could do - ditch METADOS2. Pick up a copy of
ExtenDOS Professional and use that as your CD-ROM driver program
instead - it's way more stable and easier to set up. I know of more
people who use this program to access their CD-ROM drives than
METADOS, including a few Falcon owners. Plus Roger Burrows of
Anondyne Software offers excellent customer support.

c> calculations.
c> Just look at TOWERS II.

I agree that it would be faster if DSP would be used! But I think so
would Towers II. Do you know for sure that Towers II uses DSP to
calculate texturemappings etc.? I know Towers II uses DSP to play
musics but I doubt it uses DSP to calculate texturemapping.
I doubt it because it's not that fast. Wolfenstein 3D is about
the same speed on 386sx/16MHz as Towers II is on the Falcon.
But great game that Towers II, can the Iron Golems be killed?

: Come on Hendrik.. At least there is alternatives, which is one thing we
: can't say on our Atari. And have you btw. ever heard of OS/2 ? I guess not
: otherweise you wouldn't be trying to flame Roger like that.

: HM> Whom ary YOU trying to kid?

: No need to kid anyone. You obviously don't know enough about PC's.

Is this an Atari area, or what ? It seems like we have more and more
ex-atarians, current PC/Mac users, or whatever, telling us how great
computers PC and Mac are. As if we didn't already use them both;
somebody at work, somebody at school, somebody at home...

I think, most of us know quite enough of PCs not to want to own one.
What's so strange with that? Or should Mac-users remind PC-users of what
they're missing, and vice versa?

I'm myself writing this on a PC right now - and boy, I miss my Falcon and
its decent telecomms programs like Connect ;-) ! This machine sucks. But
it's all I have here. Owning both an Atari and a PC, I should know?

But then again, somebody will come and say: "hey, jerk: you must own some
ancient PC - come n' get a real PENTIUM with WINDOWS 95 and ..., and soon
you'll wonder why you ever used something else" ;-) !

Message-ID: <ttracy-2604950940000001@dyn-127.direct.ca>
Source record: 166831

Hope someone out there can help me...

I'll have to state upfront that I don't know a thing about Atari computers -- however, a good friend of mine would like to use his to log into a standard unix shell account to send/retrieve internet email. I got an external modem for him, and he got a cable from some Atari shop, but they apparently were not very helpful when it came to the issue of a communications program.

What he needs is something very basic: something in the way of a shareware comm program to simply log on and read his mail occassionally.

Any suggestions...?

Please respond via email to me at ttracy@direct.ca

Many thanks in advance...

- Tony

Yeah, and all they lost was the Trash Can wasn't it! ;)

1564. Mega STe External Hard Disk

Newsgroup: comp.sys.atari.st
Date: 1995-04-26 00:00:00 UTC
From: Dennis McGuire <mcguired@moose.erie.net>
Message-ID: <Pine.LNX.3.91.950426133611.28744C-100000@moose.erie.net>
Source record: 166833

I recently got my son a Mega STe. We tried to move his files
from an old Megafile 30 to the intenral hard disk on the Mega STe, but it
wouldn't recognize the external drive. The Mega STe has a 50 Meg Seagate
at SCSI ID 0 which is running the AHDI hard disk driver. The Megafile was
SCSI ID 3.

Figuring the problem was with the Megafile, I hooked it up to a
1040 STe and moved the files over to my Syquest drive. Well, the Mega
STe doesn't recognize the Syquest either! I normally use the ICD booter,
but AHDI was already on here. When I run IDCHECK, it lists the SCSI ID
of the Syquest, but it says "Unecognized unit".

Any positive advice would be appreciated!

Most MIDI sequencers will run happily in 1MB of memory as long as you don't have too many TSRs or desk accessories (similar to Mac DAs if that's any help) and since these can often conflict with sequencers due to the latter's requirements for (hopefully) precise control of the hardware. 2MB will give you a little more room, allowing you to run the (rather excellent) NVDI, a software accelerator (yes!) which I, and, I think, many others would wholeheartedly recommend. If you're on a tight budget, the Accompanist or Alchemie are both excellent shareware sequencers, or, if money's no object, go for Cubase or Notator Logic (from Steinberg and Emagic respectively) which are immensely powerful, reasonably easy to use and absolute industry standards, which means that they'll be around for a few years yet. Incidentally, the latter two programs are modular in design, so if memory is tight, frills <g> such as the score editor need not be loaded.

As far as checking the amount of memory goes (as the previous poster mentioned), can I take this opportunity to, once again, blow the trumpet of the rather wonderful (and free at an FTP site near you) FCopy III, which will format and backup your disks (in all sorts of weird and wonderful configurations, including directly DOS-compatable) and will also show you how much memory you have fitted. If you have less than 1MB then get an upgrade - prices over here are approx. UKP35 for an add-in board with

2*256KB SIMMs on it. If you've got an STe (you were rather unclear here)
then just pick up 2*256KB 100ns or better SIMMs (over here approx. UKP10).

From: dhohenst@gpu2.srv.ualberta.ca
Message-ID: <3nlv2c$130g@rover.ucs.ualberta.ca>
Source record: 166840

I did figure out that the Speedline autotracer for Calamus uses an
FPU. Unfortunately, I can't seem to run Calamus with the FPU!!! It
locks up while loading. I pulled out the PAL chip that tells the
computer an FPU is present, and everything worked great! Except now, I
don't really have an FPU, now, do i?

Is there a problem with the PAL chip? I think I remember hearing
something about troublesome PALs or fixes for them or something.
I downloaded a serialfix program that said int he description that it
also dealt with "the PAL problem". unfortunately, the text on how to fix
it is in German.

1573. HSMODEM and MiNT, how?

Newsgroup: comp.sys.atari.st
Date: 1995-04-26 00:00:00 UTC
From: avg@cwi.nl
Message-ID: <avg.798895015@news.cwi.nl>
Source record: 166842
Body handling: HTML body converted to readable text

Hello all.

I recently succeeded in getting MiNTnet and a SLIP line to my
UNIX box running! (finally, after 6 months or so... :-)

Now I would like to get 115200bps from my TT's Serial 2 port
rather than the poor 19200 I am currently running SLIP on;
otherwise using the TT as an X terminal will be annoyingly
slow.

I tried HSMODEM, and it works fine on plain TOS; but with
MiNT there is a problem; run the patches before MiNT, and
MiNT throws them out; run them after MiNT (that is from
MINT.CNF or /etc/rc), and I get the usual friendly MiNT
system crash report, i.e:

Something happened. Press a key for more info.

Fatal error. You must reboot.

(by the way, can someone do something about this behaviour?
it is _so_ immensely dense---I mean even a row of bombs
is more informative, and it doesn't require you to press
a key before you realize that you need to reboot)

Shouldn't the HSMODEM patches be included in MiNT, together
with a flag that enables the high speeds, much like what
Linux does?

If someone is reading this far, would anybody know where
to get 'xhost'? Running X on my 6 meg TT is fine, except
that the second x terminal runs out of memory... Running
plain X and doing the rest from my Linux/486 would be very
nice, but without an access control utility I don't get
very far... (connection to X display refused).

] in a variety of publications over the years I've seen that there
] were a lot of accolades over the fact that the ST was, for its time,
] a very revolutionary computer - better colour than a PC, a stable,

And if it was so crap, then how did the ST win "Computer of the Year"
award in IIRC '89!?

The only reason PC's are "good" (cough, choke, ahem), is that due to
marketing superior to any other platform, they have unfortunately, become
the standard, and therefore have a sh*tload of developers and software
houses producing for them. Most of what is produced is about as
efficient and well designed as the machines themselves, but what do you
expect when the minimum hard-drive size these days is 500Meg+ and you
are expected to have at least a 486-DX 50Mhz....

Even trying to do simple spreadsheeting is quicker on my 8Mhz STe than
a 50Mhz 486 under Windoze, now try and tell me that is how it should
be!?

] Unfortunately there is no automatic demo, documentation or email
] address so I don't know what more I get after paying the 25 pounds
] sterling for the full version. I'm tempted.

That's what I was wondering, no doc's of any kind.

Also, their spelling leaves a bit to be desired (if I'm paying for something
at least they could get simple things like that correct).

Also, in the last scene, being hit by one of the energy bombs, and being
thrown back in time results in the game crashing after the time-warp
sequence ends. (On a 2.5Meg STe).

Other than that, the sound is good, sequences are well done, gameplay
is good, what more do you need!? (A bit more variety perhaps, but no
doubt it improves in the full version :)

If you've got a 1meg STe or better, check it out!

Coo its been a long time since I've played it... but...
you need to do a few things that include going to the library for the
map to the next island (library is very top right of the map of the town).
You can also buy nice weapons in the town (chaos armour, etc) and you
need some warm coats and gloves and hats from one of the clothes shops.
There is also an animal you should buy... some bird.. I'll dig out out
the players guide tonight and post the info here if you want :)

I have gotten very few AVIs to work with the AVI player you mention...
usually I get a dialog box saying something in German. I believe the
phrase you mentioned means "bad image information", although I'm sure I'll
be corrected if wrong.

I think the author means it when calling it a "primitive AVI player".

This is also possible. NVDI 3.02 does sth like a CRC check on all the
fonts when it starts. You can disable this by setting a line
FONT_CHECK=0 (or CHECK_FONTS?) in your nvdi.inf file.

But it is still possible to have fonts which pass this check and which
NVDI still rejects for other *unknown* reasons :-(

>GUI interface (that NO PC at the time had)..

Er.. no..

The PC *already had* exactly the same GEM interface that was later used on the Atari ST. Digital Research was in fact sued by Apple over the "look and feel" of GEM on the PC because it was so similar to the Macintosh.

I've just got eb_edpov.lzh and it's running.

How do you make a simple shape appear in the scene ?
All I get is a white square (one side missing) with a diagonal line in it.

Sadly, my French is pretty bad although I can usually make out what is being
said.

Do you need MTOS running or is it optional ?

Cheers,
Phil.

Surely there's not much point without a brief review of each one. I
wouldn't buy one just because it's on a list. Where to get it and how much
would be useful too.

I know of no way to patch around this. I have been told that one can load TOS 1.4 from disk and enable the use of some stuff, but that is not going to help much for copy protected games. I do know of some cases where cracked versions of games will work on the MSTE, when the original disks will not.

Oh, there are also some games that will work until they try to do anything with sound (the Spectrum Holobyte flight simulators being the example that springs to mind). You can sometimes get around this by turning the sound off, though silent games are a bit of a drag.

> Someone else has also sugested that it might be the extra memory on

There is a make512 in /Utilities on atari.archive.umich.edu. I think the 1mb one is on there somewhere as well.

I have found that as long as I access the floppy drive while in TOS (I just
double-click on drive A to get a directory window) before I run Spectre, it
works fine as a Mac drive. This is on a MSTE4. Weird.

I concur with your advice, BTW. Given the same price, I would go for getting
the SE (I didn't see the original post).

Hi There,

Just recently, I found a NOS file on disabuse.demon.co.uk and I was reading the documentation for it. I've got a STE with 4 megs available and I wanted to know what files/programs I needed to connect to another remote site using a TCP/IP connection.

I've got the shell program (with ftp, telnet, ping etc). I need to know what the packet drivers are called that I need to get.

Someone help me ... I don't have time to wade through megabytes of document files!

Umm.. "Fractal Map Generation" and "Texture Mapping" are two *completely*
different things...

"Rescue on Fractulus" used fractal map techniques to generate the actual
physical map of the "world" the game was played in.

"Texture Mapping" involves copying a pre-defined texture (graphics pattern)
onto objects of any shape, at any angle.

Generating a fractal map takes little in the way of CPU resources, while
texture mapping graphics can be VERY time consuming.

An 8bit 6502 which could easily generate a fractal map for a game would
probably take hours to generate a single screen from DOOM...

DB3 might include such a program, but the one you really want comes with
Diamond Edge. It is called Diamond Mirror, and it closely resembles
Norton Image. You can configure it to run on every boot, once a day, etc.
It saves out (and can restore) your bootsector, partition info, FATs, etc.
Diamond Edge can use this info to make undeleting files much more reliable.
I copy the mirror files onto my boot floppy once a week or so (and both before
and after a defragg), in case of total disk failure.

I highly recommend Diamond Edge. Good stuff.

1602. FS: Digidesign Sound Tools for Mega ST

Newsgroup: comp.sys.atari.st
Date: 1995-04-26 00:00:00 UTC
From: drichard@execpc.com
Message-ID: <3nkfnu$6v3@homer.alpha.net>
Source record: 166886
Cross-posted to: comp.sys.atari.st,fr.comp.sys.atari

For Sale: Digidesign Sound Tools system for Atari Mega ST. Note, this system REQUIRES a Mega ST because the DSP board plugs directly onto the Mega ST's bus. I paid over $2000 for this system, and am asking $450 or best offer. It's in very good condition and comes with original manuals, etc. If you're unfamiliar with the system, here's what it does:

The Digidesign Sound Tools system is a hard disk digital audio recording, playback, and editing system. It can be used for mastering CD's, tapes, etc. or for editing digital audio. The system I'm selling consists of the following 3 components:

1) DAT I/O digital interface for doing direct digital audio I/O (entirely in digital domain) from DAT, Mini Disc, DCC, or a CD player that has digital output. It has both AES/EBU and S/P DIF ins/outs. This is a separate box with cable that plugs into the DSP processor described below.

2) The Sound Tools DSP, a Motorola 56001 DSP processor on a 'card' that plugs onto the Mega ST bus. This processor speeds up DSP functions, and allows things like realtime EQ during playback.

3) The Sound Designer II software. This is the software that drives the hardware described above. In addition to recording and playing back digital audio it includes cut and paste editing, scrub editing, EQ, waveform redraw, normalization, regions and playlists, fades and gain changes, smoothing, mixing of sound files, sample rate conversion, and time compression/expansion.

In addition to the components described above I also have final beta copies of the Digidesign MasterList software (For putting together a Master List of several songs with timing, blank space, etc. for a CD or tape).

If interested in this system please reply via Email to drichard@execpc.com.

Thanks,

Dean

Re: relative speeds of emulations...

Umm.. except that the PCSpeed IBM emulator on an ST was essentially an IBM computer on a board.. that is, you plugged an IBM computer into your ST, and the IBM software ran on the IBM computer. The ST was being used for the I/O only (screen, keyboard, etc..)/.

The GEMulator on the IBM emulates the ST in software.. that is, the IBM computer has to run the 68000 code by converting it all to 80x86 code before execution.

If you were to use the same trick as the PCSpeed did, ie: put an ST into your IBM (as indeed another ST emulator product does), the speed would be far greater.

In other words, it's not the superiority of the hardware or architecture that makes emulation on the ST faster, it's the type of emulation being used.

Re: Upgrading memory in a 1040ST

Unfortunately upgrading the memory in a 1040STfm is NOT easy, nor particularly reliable once upgraded.

There are no easily done "unplug a chip and replace it with bigger chips" kind of expansion available. You need to install some kind of "upgrade board" that will hold the expansion RAM and interface circuitry. Most of these are of the "solderless" variety which means they use various bizarre methods of connecting to the existing circuitry, very few of which are completely reliable.

(Atari simply did not design these computers to be expandable.)

The very BEST way to expand the memory in one of these machines is to buy a 1040STe computer and put the old one in the closet... seriously.

The 1040STe uses industry standard SIMMs for its memory, and those ARE "plug and play" easy to upgrade. It also comes with TOS 1.6 already installed, has improved graphics and sound, and other minor improvements.

I don't know what the market for used STes may be like in NZ, but I bought a 1040STe a year ago, already upgraded to 4 Megs, for US$125.

The old 1040ST can be used as a backup system, or sold for whatever you can get for it...

: If you have an STE you have to buy 4 1MBit*8 or 1MBit*9 SIMMs.

On the other hand if you have an STFM, STF, ST etc you can use the
Marpet Xtra Ram board which plugs on top of the shifter and MMU and
takes SIMMS. This can take you up to 4MB.

Message-ID: <3nlnff$6dv@noc1.portland.net>
Source record: 166895
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'm trying to get Ghostlink to work between my 1040st & 486. With the ports setup as described in the docs and the computers connected with a null modem cable..nothing happens when I try to open the drive icon on the ST, it locks busy until I abort with contorl/shift/alt.
Is there any extra configuration required on the PC side other than running PCslave and setting the baud rate & port? Any help would be greatly appreciated. Thanks!

Huh? CoMa 2.80 came out just a week ago. I haven't had any problems setting
it up, and it uses hsmod drivers for it's access to ports, so it shouldn't
have any problems with alternative ports.

^^^^^^^

That's about as fast as a Falcon can do. The NCR SCSI-chip could go faster,
but the DMA is the limiter here.

>The only problem seems to be that I can't copy files bigger than 4MB

Dunno, but doesn't sound plausible to me.

Which driver are you using? AHDI 6.061 was especially modified, to cope with
these kinds of problems in certain Falcons (SCSI-transfers made slower).

AO> freeware? Either, arcade type or stragedy shootem ups, D&D
AO> etc...

Running in which resolution?

If in monochrome, I'd definitely recommend SLATRIS (an excellent TETRIS clone), OXYD, SHOCKER II, SUPER BREAKOUT, and NO LIMIT II (maybe not as nice as OBSESSION, but it's the only pinball simulation that runs in monochrome that I know of!). Oh, and WORMMANIA.

If in colour, definitely LLAMATRON 2112 and REVENGE OF THE MUTANT CAMELS, and what I've seen of TOWERS.....

ST folks,

Thanks, everyone, who answered my original post. It's great to have
a group like this around when you need information. I'm following everyone's
recommendations in regards to monitor placement.
One followup question however: Does a monitor magnetized by speakers
like mine has been, have some ability to repair itself if put in the proper
place? Does it have a degausing strip around the parimeter of the screen?
Or will it have to have service?

Thanks everyone,
This group is great.

Of course you can! This is a well known strategy for ST users who have a deskful of cables. If you get a big enough case you can even transfer the ST motherboard into it.

You can pick up used PC cases with big (200w) power supplies and cabling very cheaply. Just make sure you count up the number of 5.25" and 3.5" peripheral bays you want.

Nobody told you to own an PC. I personally don't give a damn what computer
you're using. But when person like Hendrik try to tell others about his
experiences with a PC, then people, who know better, are entitled to correct
this. Even though it's an Atari newsgroup.

I'm already in the FFF Richard, and work together with them to get the files and information across the nets, we even have a N.FALCON.FACTT_FILE echo dedicated to them. Both Colin and Kevin are close friends.

As a matter of interest NeST is now at least 30% bigger than any other ftn nets around, covering 18 (19 really) countries.

We of course have a corresponding membership which far outstrips the FFF if you want to count numbers.

Could I ask a dumb question?
I'm more familiar with the PC and my Atari, so.., which Mac's
can run system 7 and have the 68030, and thus are capable of running
MagicMac?
I have read of current models which are suitable, but it is more likely
that owners may be selling their older Macs, my only interest would (at first)
be as an alternative to buying a Falcon. So which ? (LC's II's or SE etc)

> there which she could use to get the doc's back. Thanks.

If you mean 'threw away' as in 'deleted' then the short answer is yes,
providing that she has not saved any other files on the disk. There is a
small program called UNDELETE.TTP (which I got with ST-Knife from an ST
Format mag) which will undelete the file. If you want a copy of this
program, email me, as i'm sure people wouldn't appreciate lots of
UUENCODED stuff in here :-)

If she 'threw' the disk away ... then the only solution may be to type
the documents back in again!

> looking for a Atari ST utility to read and write DOS disks.

If you format a double density disk on an ST (720K), it should be
compatible with the PC format. The same goes, but it will not work for
1.44MB disks 'cos of the different surface media etc. There is a wee
desktop accessory somewhere called 'Diamond Format' which will write a PC
compatible boot sector to a standard 80 track 9 sector ST disk which I
assume make it PC compatible.

I'm not sure of the validity of this statement, but I don't think
standard ST's can format PC compatible disks!

: Hmmm. I think you've done this the wrong way round. Should be:

: <>

True,

Progs I have that use the FPU:

Kandinsky - GEM vector drawing package (SHAREWARE)
CBZone - Battlezone clone (PD)
Epic - Superb Graphic game - autodetects FPU on bootup (COMERCIAL)

there may be more - I am still checking through my collection.

Most language compilers have FPU libraries to speed up math. Lattice
C has it as a standard compiler option. Most raytracers and the like
also use FPUs if found, although I have never tried them.

BobR (76702.1466@CompuServe.COM) wrote:
: Re: Upgrading memory in a 1040ST

: Unfortunately upgrading the memory in a 1040STfm is NOT easy, nor particularly
: reliable once upgraded.

I beg to differ on both these points...

: There are no easily done "unplug a chip and replace it with bigger chips" kind
: of expansion available. You need to install some kind of "upgrade board" that
: will hold the expansion RAM and interface circuitry. Most of these are of the
: "solderless" variety which means they use various bizarre methods of connecting
: to the existing circuitry, very few of which are completely reliable.

I have had an Xtra Ram board in my Atari for about a year now and
have had NO TROUBLE since then. It plugs ontop of the Shifter and MMU
and has worked fine since I put it in there.

: (Atari simply did not design these computers to be expandable.)

True - but there are ways.

: The very BEST way to expand the memory in one of these machines is to buy a
: 1040STe computer and put the old one in the closet... seriously.

How much is an STE ?

How much is a Marpet Xtra Ram board ? about 20 UKpounds unpopulated.

Think again!

I bought the board with 4 x 1MB simms for 99 UKpounds. This is the
same price you are going to pay for 4 x 1MB simms to put in your STE.
(These prices are all NEW from shops - you can pick up simms cheap
second hand!)

: The 1040STe uses industry standard SIMMs for its memory, and those ARE "plug
: and play" easy to upgrade. It also comes with TOS 1.6 already installed, has
: improved graphics and sound, and other minor improvements.

The Xtra Ram board takes Simms also.

: I don't know what the market for used STes may be like in NZ, but I bought a
: 1040STe a year ago, already upgraded to 4 Megs, for US$125.

Hi,

you can find information on sds at the following sites:

List of FTP sites supporting MIDI Sample Dump Standard (SDS)
==========

---

alf.uib.no

Directory: /pub/sds

This site contain SDS related programs (MS-DOS) and documentation. Also
includes samples. This is the official site for the SDX programs.

---

ftp-ls7.informatik.uni-dortmund.de

Directory: /pub/samplevision

This site contain about 14MB of SampleVision stuff (might be on the move).

---

sweaty.palm.cri.nz

Directory: sds

This site contain SDS related programs (MS-DOS) and samples. Also includes
Emax stuff.

==========

If you know of any other SDS related sites, or any info in this list is not
correct, send message to: K.Gjerde@uib.no.

>One other point the Falcon here has no resale value here....

These days it's rather naive to think *any* computer has resale value.
If I'd bought the `top of the line' PC two years ago (which was
something like a 468DX2-66), this system is now the *smallest* one our
local PC store has in stock. You can argue about the power of the
newer PC systems versus that of the Falcon, but you can't argue that
the `rate of decay' of PC's is *awful*. Personally I find it much
less irritating to have to wait five minutes to download the latest
and greatest software as opposed to buy it in the shops, that to see
the `top' system I bought yesterday being dropped today.

Yes, and those awards are based on appearance, not capability.
So, if you want the prettiest computer of 1985 (or whenever!) you can
probably pick one up pretty cheap these days. But don't complain about
the dearth of dealers or software! Your closest dealer is probably in
New Zealand.

> MiNT throws them out; [...]

As far as I understand the issue, this is not true. MiNT uses the
HSMODEM routines to some extent (to the same extent any non-HSMODEM-
aware program would use it, i.e. the routines sitting in the BIOS
trap). However, MiNT doesn't directly use HSMODEM ``callbacks.''

> Shouldn't the HSMODEM patches be included in MiNT, together
> with a flag that enables the high speeds, much like what
> Linux does?

This would be ideal. However, this would require (a) the HSMODEM
sources to be free, and (b) that someone would be willing to rewrite
them into a new serial driver for MiNT.

1648. ST Keyboard for Sale (UK)

Newsgroup: comp.sys.atari.st
Date: 1995-04-27 00:00:00 UTC
From: Alan Gauton <ag@spd.eee.strath.ac.uk>
Message-ID: <Pine.SOL.3.91.950427154055.2415A-100000@humpback>
Source record: 166711

I have an old ST keyboard kicking around at home, which I replaced
because the joystick port broke.

The symptoms are that whenever you play a game requiring the joystick,
there is effectively a permanent up-press on the joystick, eg playing
Kick-off your player automatically runs up the pitch, and he won't come
down :-).

The mouse port works fine, and the keyboard itself is still perfectly OK.

If anybody in the *UK* is interested, make me an offer by e-mail.

They don't distribute it unencrypted, mostly to satisfy the data protection act. An encrypted archive (members can 'phone Kev or Colin for the code) used to be distributed in the 90_FFF fileecho on NeST (I think it's on a Fanfiles fileecho now instead) I don't think it is currently on the internet but I'm sure it could be put on there.

Hello,

I am trying to use TeX with my MiNT/X11 setup but I have the following
problem: The CTEX prgram (Gem) takes care ofthe %format line at the beginning
of the TeX file. In MiNT however I just type tex file.tex at the command line.
It refuses to do anything with LaTeX!! How do I get TeX to use the LaTeX
package?

And How do I set the XDVI fontpath ok to use xdvi along with TeX?
(I have to convert the .dvi files with dos2unix to view them, is this normal?)

Greetings, and many thanx in advance

Florentijn

Phil's original message suggested that you should join both.

NeST is much better for atari users than usenet IMO. Possibly not as
useful but a lot more fun. And there's a Falcon FacTT file area on
there...

1657. ST/MS-DOS floppy format differences...

Newsgroup: comp.sys.atari.st
Date: 1995-04-27 00:00:00 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HPU2TD9SVMAIDPQ0@SNYONEVA.CC.ONEONTA.EDU>
Source record: 166720

Hi all.

As a former STe and Falcon owner for many years I'm well aware of most of the main differences between the ST's pre-TOS 1.4 disk format and that of the PC.

However, there is one thing I'm not comepletely sure about...

I remember reading somewhere that the ST format has a different sectors per FAT than MS-DOS uses. The ST uses something like 5 sectors per FAT where MS-DOS only uses 2. Is this correct? I know there IS a difference and this particular difference is one of the main reasons why MS-DOS has trouble reading some ST disk (i.e. the boot sector and media byte differences aside).

I'd appreciate any info on this issue. Please e-mail me directly becuase I don't get to read this group as much as I'd like to.

Thanks,

Ari

>
>To the average Atari user PC clones are to hard for them....!!!

I use a PC at work, I know a lot about them from finding all the problems caused by installing software/hardware - they're one big kludge.

I saw today that it's estimated that 1 million PC's were sold in the UK over the last 12 months TO HOME USERS - I have also seen at another time an estimate that between 2-3 out of 10 users mess up the system (CONFIG.SYS, AUTOEXEC.BAT and WIN.INI), can't put it right and never use the thing again. That's at least 200,000 PC's which don't work just this year.

How many others have programs that don't work because of system clashes which they can't trace? Most of these people have an average education and have been conned by Intel hype that they NEED a computer, with no previous experience of computers how will they cope - their local expert will be barely ahead of them in terms of knowledge - I speak from experience.

It seems to me that PC owners find their computer is too hard for them!

Phil.

Jon Kale <jon@powerslv.demon.co.uk> wrote:
>Can anybody point me to an SDS FAQ or answer a couple of queries I've got....

Here ya go. There are a couple of confusing parts -- ALL values are in
the 7-bit encoding form they describe; this took me a while to figure out.

MIDI SAMPLE DUMP STANDARD

1) INTRODUCTION

The MIDI SDS was adopted in January 1986 by the MIDI
Manufacturers Association and the Japanese MIDI Standards Committee.
The SDS defines the standard method for transfer of sound sample data
between MIDI-equipped devices. Sample dumps may be accomplished with
either an 'open loop' or 'closed loop' system. The open loop method
simply involves the straight dump of all sample data from its source
to the destination, with no timeouts, packet acknowledgements, or any
other form of handshaking, much as in the manner of a sysex bulk dump,
usually intiated at the source. The closed loop method allows the use
of handshaking messages between the dump source and destination, and
usually places the dump process under the control of the slave, to
allow it time to process the incoming data as necessary. As with any
standard, it can not be assumed that a device adheres to it unless the
accompanying documentation specifically indicates it. Even then, it is
best to check its conformity with non-critical data.

2) SPEC: SAMPLE DUMP FORMATS

DUMP HEADER:

F0 7E cc 01 ss ss ee ff ff ff gg gg gg hh hh hh ii ii ii jj F7

where

cc = channel number
ss ss = sample number (LSB first)
ee = sample format (number of significant bits; 8->28)
ff ff ff = sample period (1/sample rate) in nanoseconds (LSB first)
gg gg gg = sample length, in words
hh hh hh = sustain loop start point (word number) (LSB first)
ii ii ii = sustain loop end point (word number) (LSB first)
jj = loop type (00:forwards only; 01:alternating)

DATA PACKET:

F0 7E cc 02 kk <120 bytes> mm F7

where

cc = channel number
kk = running packet count (00->7F)
mm = checksum (XOR of 7E, cc, 02, kk <120 bytes>)

The total size of a data packet is 127 bytes. This is to avoid
overflow of the MIDI input buffer of a device that may want to receive
an entire packet before processing it.
A data packet consists of its own header, a packet number, 120
bytes of data, a checksum, and an EOX. The packet number begins at 00
and increments with each new packet. It resets to 00 after it reaches
7F, and continues counting. The packet number is used by the receiver
to distinguish between a new data packet, or a resend of a previous
packet. The packet number is followed by 120 bytes of data, which form
60, 40, or 30 words (MSB first for multiword samples), depending on
the length of a single data sample.
Each data byte hold seven bits, with the msb in each byte set to
0, in order to conform to the requirements of MIDI data transmission.
Information is left justified within the 7-bit bytes, and unused bits
are filled with 0.
Example: Assume a data point in the memory of a 16-bit sampler,
with the value 87E5. In binary, that would be

1000 0111 1110 0101

and would be encoded as the following MIDI data stream:

01000011 01111001 00100000

The checksum is the running XOR of all the data after the SYSEX
byte, up to but not including the checksum itself.

3) SPEC: SAMPLE DUMP MESSAGES

DUMP REQUEST:

F0 7E cc 03 ss ss F7

where

cc = channel number
ss ss = sample number requested (LSB first)

Upon receiving the request, the sampler checks the sample number
to see if it is within legal range. If it is not, the request is
ignored. If it is, the sample dump is started. One packet at a time is
sent, under control of the handshaking messages outlined below.

HANDSHAKING MESSAGES:

For all below:

cc = channel number
pp = packet number

Packet numbers are included in the handshaking messages to
accomodate machines that have the intelligence to re-transmit specific
packets after an entire dump is finished, or if synchronization is
lost.

ACK : F0 7E cc 7F pp F7

Means last packet was recieved correctly (checksum OK, etc),
please send next one. Packet number is packet being acknowledged as
correct.

NAK : F0 7E cc 7E pp F7

Means last packet not received correctly, please send again.
Packet number is packet being rejected.

CANCEL : F0 7E cc 7D pp F7

Means abort dump immediately. Packet number is packet on which
abort occurs.

WAIT : F0 7E cc 7C pp F7

Means pause dump indefinitely, until next message is sent. Allows
the unit recieving the dump to perform other functions (disk access,
etc), before receiving the remainder of the dump. The next message it
sends (eg ACK, ABORT) will determine if the dump continues or aborts.

4) DUMP PROCEDURE: MASTER (DUMP SOURCE)

Once a dump has been requested, either via MIDI or through the
front panel, the DUMP HEADER is sent. After sending the header, the
master must time out for at least two seconds, to allow the receiver
to decide if it will accept this sample (has enough memory, etc).
If it receives a CANCEL, within this time, it should abort
immediately. If it receives an CAK, it will start sending packets
immediately. If it receives a WAIT, it pauses until another message is
received, and then processes that mesage normally. If nothing is
recieved within the timeout, an open loop is assumed, and the dump
starts with the first packet.
After sending each packet, the master should time out for at
least 20 milliseconds and watch its MIDI In. If an ACK is received, it
sends the next packet immediately. If it receives an NAK, and the
packet number matches the number of the last packet sent, it resend
that packet If the packet numbers don't match, and the device is
incapable of sending packets out of order, the NAK will be ignored.
If a WAIT is received, the master should watch its MIDI In port
indefinitely for another ACK, NAK, or CANCEL message, which it should
then process normally.
If no messages are received within 20 milliseconds of the
transmission of a packet, the master may assume an open loop
configuration, and send the next packet.
This process continues until there are less than 121 data bytes
to send. The final packet will still consist of 120n bytes, regardless

of how many significant bytes actually remain, and the unused bytes
will be filled with zeroes. The receiver should handshake after
receiving the last packet.

5) DUMP PROCEDURE: SLAVE (DUMP DESTINATION)

When receiving a sample dump, a device should keep a running
checksum during reception. If its checksum matches the checksum in the
data packet, it will send an ACK and wait for the next packet. If it
does not match, it will send an NAK containing the number of the
packet that caused the error, and wait for the next packet. If, after
sending an NAK, the packet number of the next packet doesn't match the
previous packet number (the one that was NAK'd), and the unit is not
capable of accepting packets out of order, the error is ignored and
the dump continues as if the checksums had matched.
If a receiver runs out of memory before the dumpo is completed,
it should send a CANCEL to stop the dump.

6) SDS OVERVIEW

SAMPLE DUMP DATA FORMAT: DUMP HEADER:

Sysex
ID: Universal Non-Real Time
Channel Number
Sub ID: Header

Has anyone managed to setup NOS or Demon NOS to connect to a dialup internet provider? I get assigned a different IP Address every time I call and have tried to change the IP address in NOS, from the net> prompt but that doesn't seem to work. Also if I try to connect using PPP I always lose carrier. Using SLIP I don't lose the connection but can't communicate with the other side.

Any help would be greatly appreciated. I am moving soon and all my calls will be long distance and I really want to cut down the time I spend online.

Thanks in advance

Brad

>disk. I have tried the holding shift keys during bootup but it has no effect

You need to do a hard reboot. A soft reboot won't take MagiC out of memory. On my systems I do Control-Alt-RightShift-Delete for a hard reboot; try that.

Thanks for the help. I've been using ICD software since before the ST was introduced, and it's installed properly. The problem is not on the ST but on the TT. MagiC crashes as soon as there is any disk activity. Under AHDI, MagiC runs perfectly on the TT. This is ICD Pro 6.2.3, as I recall (a guess).

I installed Tcache with the latest version I could find of AHDI and I'm happy.

: Can anyone recommend a PD game worth playing? What are your favourites
: amongst our ST public domain...whether shareware or freeware? Either,
: arcade type or stragedy shootem ups, D&D etc...

Two I got recently (though they're dated 1992) are really worth getting:

Aeris: Very clever logic game from France
Manciola: A variation of above, by the same author; also great.

ALso, my other favourites:

Hector and the Mutant Vampire Tomatoes from Hell
Cybernetix (Defender-type game with raytraced asteroids)
Anything by Dave Munsie
Spectral Sorcery (Hex-style game; fantastic, if old)
Blox (Dave Bagett's contribution to the Tetris-style games)
HAc-Man II (Another Dave Baggett classic)
Colour Clash (A bit cheesy, done in STOS, but a great logic/puzzle game)
OZone (Definite classic, even if there are no sound effects)
Critical Mass (100% Pure assembler, parallax scrolling, digital sound, etc)
Chaos (ST version of the classic Spectrum game by Julian Gollop)
The Original (Boulder Dash to the Nth Degree; very excellent)
Grav & Grav II (More good stuff)
Anything by Jeff Minter, of course
Ataxx (Very nice vertical shooter)
Starball (Excellent Pinball)
Wyrd Wayz (Very nice battle/puzzle game)
Topas (Archon of the 90s ...unfortunately (for me) in German though)
Reflection (Logic game; extremely nice, especially considering it's STOS!)
Downfall (Don't be fooled by the size; this is a very clever 2 player game)
Stomp (Very clever puzzler)
Demolition Man (Clay Walnum's contribution to the Minesweeper games)
Darklyte (Fantastic mission-driven strategic sci-fi wargame)

There are probably others, but these are my utmost favourites. All of them
are very much worth getting (No dogs in this lot), and I'm almsot certain
that every last one of them can be found on atari.archive.umich.edu.

From: cm3hirjd@bs47c.staffs.ac.uk
Message-ID: <3np8f4$r7j@bs33n.staffs.ac.uk>
Source record: 166744

It finally happened... I ditched my nasty little internal IDE drive from my Falcon that was giving me so much grief and bought a spanking brand new external SCSI 730meg.. it works like a dream.. however I removed the IDE from the Falcon in order to place it in my PC laptop (where it now runs fine!) but my Falcon takes an AGE to boot.... its as if its scanning for an IDE and can't find one but takes about 20 seconds to determine that there is nothing plugged in, it then boots the SCSI and works fine.

So.. how the hell can I get it to stop searching for the IDE? Don't tell me I'm stuck with a slow booting Falcon until I buy a little 20meg IDE to stop this annoying problem! It happens at every reset.. and is most most frustrating.. perhaps some STF or AW contributors would care to add this to one of their Question and Answers pages respectively...

> Progs I have that use the FPU:
>
> CBZone - Battlezone clone (PD)

In the standard distribution of CBZONE10 for the Atari - there are only 2 executables:

68000 only
68030 + FPU (which also works on 68020 and under MacMagic AFAIK)

The source is all there to build a 68000 + FPU version - there is even a Lattice .prj file for that config. The binary is missing as I was unable to find anybody with the 68000 + FPU combination for testing. However if anybody would like such a version - then I'm willing to compile one up.

:-)

Roland.

@CiX

PS the original CBZONE02 had autodecting FPU code which *should* work on a 68000+FPU combination - but its a poor version and the Lattice FPU autodetecing code is quite slow and apparently none too reliable.

Y'know, I wish there was a seperate group for Atari games only. It's a real pain for us game freaks having to look through lots of techy articles.

I'm not slagging off techy minded people, as it's them that make the world go round and write stuff, it's just I'd like a completely games orientated group, like on other machines, even ones as small as the Arch (when I say small, I am ignoring the countless thousands of schools that own them in britain.)

Well using a standard PC shouldn't cause any problems that I can think of, the only possible problem I can think of would be the power supply & its connections. I'd go for a small tower unit if possible, as they look the business and are easier to cable up inside...

I've just installed a 540Mb SCSI-2 Hard disk and a 16Gb DAT drive (overkill, but who cares!) into an ordinary PC Midi-Tower case. All the cables fit beautifully, and my Link II is bolted to the rear of the case for stability.

Obviously all the PC type crap (turbo/reset button and Mhz display) ain't worth spit to the ST, so you should find it easy to bolt together something cool. When the prices of >1Gb disks comes down a bit more, I'll be after one of those too... :-)

Hope this helps?

Darran.

Since when a computer has become an investement? Get gold, shares or
livestock! Everyone knows that a computer price falls 50% as soon
as you drag it out from a shop, and in 2-3 years it will be hard to
sell because computer-companies have somehow conned people to believe
they need the latest brand.

Your money is lost in any case, unless you DO something with your computer
and sell the product.

You should have no problem putting your peripherals in a PC case. One of the most talked about modifications at my local users group is a tower TT. It looks good, and you have 3 or 4 bays to put your toys in.

A word of warning to anyone who tries this. an ST/TT motherboard is apparintly longer then a PC's, so you need a big tower to fitit in. I think the power supple had to change sides to.

Jarl is out of here...

Hi Julian,

Not a true reply, but do you know if there are any implementations of the Jekyll protocol for IBM computers? I've got an STe with Jekyll v1.38 too and it's brilliant. I believe the source is PD, but if someone's already done a swish interface, then there's no point re-inventing the wheel!

I've got a very* good fractal generator for all* ST computers, it will take advantage of any coproccessors/'030 ('040?) it sees, it's based on a PC program called Fractint, its written to be 100% leagal code, so it should work with any* graphics cards you might have. Its called Fracgen, check it out! I have no idea where to get it from though...

Getting software and getting support are two entirely different things.

Do you think MS give a little piece of shit when you encounter a problem
(plenty there, believe me) with one of their applications?

>and software distributers like 2B and Heidleberg, it's waste of time hoping
>for anything.

You are an idiot. Let me repeat I-D-I-O-T.

Do you know any of those folks? I happen to know Wilfried and Sven personally,
and I've met some guys from ASH on several occasions. They have contributed
considerably over the last decade, and don't deserve the attitude you're
presenting here.

You haven't even registered your UUCP-Package. So where is YOUR contribution
to the Atari community, ey?

What about Linux68k, OS9, KAOS, MagiC, etc?

And for me personally, WinDoze isn't an alternative at all. I haven't seen a
decent UUCP package for WIN, yet.

And yes, I've heard about OS/2, but Roger wasn't referring to it, was he?

>HM> Whom ary YOU trying to kid?
>No need to kid anyone. You obviously don't know enough about PC's.

Yeh, right.

I happen to use them at work every day, and I am partly responsible for our
Novell 3.12 net and all the administrative stuff related to it.

But have you ever installed OS/2 on any machine? It has its pitfalls as well,
and it is not that easy to get a good installation which takes full effect of
the hard & software. Have fun with it anyway, go ahead and annoy the PC
related groups.

Bye!

CM> has ever been a TV-spot on the screen in Germany? I think not only one
CM> has occured.

I seem to remember someone in one of the other areas mentioning that there had been some TV marketing in Germany, but I won't swear to it. What irritated me about the Z-TV spots was that they were randomly placed in an "ungdomsprogramm" which was 2 1/2 hours long and that you had to watch the whole show in order to be sure to catch the Jag ad. Putting up with that much of *that* show just to catch a 20 second spot for Jag was too much. And, like I said, Z-TV only covers a very small part of the Swedish audience even if everybody who _can_ watch it _does_ watch it, which they _don't_!!

1706. FS: Digidesign Sound Tools for Atari Mega ST

Newsgroup: comp.sys.atari.st
Date: 1995-04-28 00:00:00 UTC
From: drichard@execpc.com
Message-ID: <3npq3l$9tb@homer.alpha.net>
Source record: 166622
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.st,comp.sys.atari.st.tech,fr.comp.sys.atari,rec.music.makers.marketplace

For Sale: Digidesign Sound Tools system for Atari Mega ST. Note, this system REQUIRES a Mega ST because the DSP board plugs directly onto the Mega ST's bus. I paid over $2000 for this system, and am asking $450 or best offer. It's in very good condition and comes with original manuals, etc. If you're unfamiliar with the system, here's what it does:

The Digidesign Sound Tools system is a hard disk digital audio recording, playback, and editing system. It can be used for mastering CD's, tapes, etc. or for editing digital audio. The system I'm selling consists of the following 3 components:

1) DAT I/O digital interface for doing direct digital audio I/O (entirely in digital domain) from DAT, Mini Disc, DCC, or a CD player that has digital output. It has both AES/EBU and S/P DIF ins/outs. This is a separate box with cable that plugs into the DSP processor described below.

2) The Sound Tools DSP, a Motorola 56001 DSP processor on a 'card' that plugs onto the Mega ST bus. This processor speeds up DSP functions, and allows things like realtime EQ during playback.

3) The Sound Designer II software. This is the software that drives the hardware described above. In addition to recording and playing back digital audio it includes cut and paste editing, scrub editing, EQ, waveform redraw, normalization, regions and playlists, fades and gain changes, smoothing, mixing of sound files, sample rate conversion, and time compression/expansion.

In addition to the components described above I also have final beta copies of the Digidesign MasterList software (For putting together a Master List of several songs with timing, blank space, etc. for a CD or tape).

If interested in this system please reply via Email to drichard@execpc.com.

Thanks,

Dean

: a decent Internet application i need this machine, (Internet In A Box).
: Unfortunatly it also means i got to run Windows, which is one thing i
: really hate.. But i'm used to live in hope, so maybe someday this application
: will be made for OS/2.

: I'm not trying to convince anyone that the PC is good.. It's just damn
: easier to get software, (read, support), insted of this Atari thing. But
: as far as the Atari goes, i've stopped hoping for anything. With programmers
: and software distributers like 2B and Heidleberg, it's waste of time hoping
: for anything.

: Greets
: Kim

So go for NT. It's still Windoze but at least you'll have a half-decent
OS. That or go for Linux for x86 and you should be able to run NCSA's
Mosaic for X Windows. Anything's better than plain old Windoze/Win95.
Hell I'm even starting to like NT now in comparison. I'd love to go with
OS/2 over Microshlop but we'll see what happens. Sigh... Well if
anything, my future kids and I will be able to use an Atari as a game
system, along with my Amiga 500.

Sorry, I was wrong. Only one EXTERNAL memory transfer per cycle.
An instruction can *refer* to three external memory locations, but
extra cycles will be inserted to cope with them.

Hi Gavin.. Well spoken, sorry i had to delete some of it, but this message
would get rather large if i didn't 8)

I'm not sure who your message was pointed at, but to make you, (and others)
absolutly sure, i do the best i can to get software for our Atari platform.
As you said yourself, a single computers market isn't good at all, and
specially not when it's based on MS developements. I'm not sure too much
software support is that bad at all, but i hate seeing everything beeing
developed on the wrong, (wrong in my opinion) platform like the PC.

We sure are. But we have to discuss our feelings once in a while, and
perhaps some developers are out there listning and may get some good ideas.

>even speed things up.

Hmm!.. I wonder if i'm talking to ST owners only.
Okay let's have it your way then. Software is beeing developed for the ST/
TT market. What do you think is going to happen on the Falcon market then
? They skipp their computer ofcouse, cause there isn't no software. They
don't go "back" to the ST/TT, thats for sure, and what are their abilities
to upgrade to something else which is beeing software supported ? None.
Whats their alternatives then ? Another platform, right ?
About the ST/TT, there isn't a future for this, and the reason is simple
as there isn't any more machines beeing created. Every days alot of
ST/TT owners are skipping their computers. Soon there isn't a market for
the ST/TT either, and what then ? Where does this put 2B and the ST/TT users
? This is what i will call 'a borrowed time periode', and it's doomed.

Have it my way, 2B (or whatever developer) create software for the highest
possible Atari machines, and if there is a need for backward compatibility
they should support this as well. This will leave them in full controle of
the market, as they could decide when people should upgrade or not.
Let's assume they have developed Magic for the Falcon _and_ the ST/TT market.
After a while they could stop the ST/TT support with the idea of letting people
upgrade to whatever is beeing supported, (ie. the Falcon or whatever is
available atm.). Normally this happens without any influense from the
software developers, as people get's used to work with their hardware
and after a while need more power.

This IS!!! how the PC manage to build such a large market.
An example:
A 286/386 user wants to run OS/2. What does he do then ? It's impossible
for him to run OS/2 on his machine as it is right now. Well, only one thing
to do then, Upgrade!! And he will do that for sure, if he wants OS/2.

The way the PC has been developed is a bit ackward as the way we normally
see. On the PC you see software beeing developed which need more power.
What happens then, the machine producers (like Intel and AMD) just create
more powerfull machines. Simple as that.
On the Atari platform this is different. We don't get the software before

the needed hardware is created. Ofcouse we could always use more powerfull processores, but we're getting used to use our slow 8/16/32Mhz as the software are all beeing developed from this need.

I'm not sure which of these two options are best. I see benefits in both. There isn't, and shouldn't be, anything wrong in developing software for more powefull hardware. The only problem is the profit which will be low for a start. (which may be 2B's problems with Magic, as Hutch and others so kindly try to convince me about). It just leaves me as an Falcon owner with nothing, and is giving me no other alternatives than to skipp my Falcon for somethng else.

>
>"Keep on Keepin' On"

I intent to do 8-)

Greets
Kim

Ps for Hutch. All this is written in my opinion ofcouse.

If you don't have a local Atari dealer to help out then pick up the phone and call Toad Computers (Maryland) at 800-448-TOAD. Another great US dealer is Computer Studio (North Carolina) at 800-253-0201.

You should know by now. :)

Consider yourself corrected, then (and probably will be again for days). :)

The Atari SF314 was most definitely the DSDD model. The SF354 was SSDD

1722. Re: ST ahead of its time?

Newsgroup: comp.sys.atari.st
Date: 1995-04-28 00:00:00 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HPVB35CSLUAIDUIG@SNYONEVA.CC.ONEONTA.EDU>
Source record: 166638

Roger:

In many ways the ST was ahead of its time. Don't forget that the machine was designed way back in 1985 using cutting edge technology and pretty much was thrown together in about 6 months.

For its day the ST had many firsts and employed many sophisticated and/or well proven technologies. Among other things, the 1985 vintage ST included a fast, 16bit CPU(the 68000), a reasonably stable windowing OS and GUI (GEM), local bus video (for very fast graphics), mouse support in hardware (not under software like in the PC), built-in I/O ports, a very fast HD controller architecture (faster than 1985 PC RLL), fast and flexible floppy drives that used DMA, an MS-DOS compatible disk format which enabled STs to exchange data with the outside world, an OS (GEMDOS) that was very similar to DOS 3.2 so that developers could port applications very easily, MIDI ports, and a decent sound fx generator.

I was 14 yrs old when the ST came out and was using both an IBM PCjr and a Leading Edge model D. I had some money in my pocket that summer so I bought the ST because it was so vastly superior in terms of features and performance. PC's were still using CGA for gfx and the poor old 8088 was really starting to show its age. I didn't go back to the PC for almost another 8 years, by which time I had owned a 520ST, a 1040STe w/HD, and a Falcon 4/85.

I only came back when the ST series was starting to show its age - when I needed to run certain programs for college classes, when I wanted to play games that were only available for the PC, and when I figured I could make more money working on game projects than I did on the ST line.

PC's became attractive only in the last couple of years for the average person because of the HUGE price drops and the wide availablity of 486 clones. Now, in defense of the PC - well, for starters its cheap. There's an incredible wealth of good programs available for it. Its reliable (not to say the ST wasn't), its inexpensive to customize and upgrade (on the ST, that's debatable), its fast (contrary to what the popular opinion is here, my 486/40 with a cheap SVGA card, and a cheap WD Caviar HD is quite fast enough for everything I need it to do - most Windoze apps included).

I'll agree with anyone who says the ST is superior to the PC as long as they're talking about a 286 or 386SX running Windoze as the difference between a 386SX/16 and a 486SX is alittle short of amazing.

Probably my biggest gripe about the ST series when I was an owner, was that Atari locked you into its 320x200x16 low rez mode. Hell, my PCjr had

the same gfx modes! Had Atari added a 256 color mode with the release of the Blitterized STe series, I might of kept my Atari. The TT had VGA video capabilities but the machine was FAR too expensive and the Falcon's are under-powered (much like a 386SX under Windoze).

Still, while I do enjoy my PC, I do miss my STs and the many fond memories I have of the machine. I might even pick one up again as my finances allow.

Well, just my two cents...

Ari

Hey guys... some of these these .signatures are real cute and a testimony
to your ASCII art capabilities, but they -are- a waste of bandwidth and
quite frankly, get a little boring after the 100th time or so! How about
a little consideration for those that have to pay for their net access
and keep signatures down to -4- lines as suggested by the Net Rules, OK?

It's your choice, of course, but many of us would appreciate it!

-Hutch- @ Fair Dinkum Tech

P.S.: Since I am wasting bandwidth here myself, I might as well try to
make good from it. Here is a quote from Brad Templeton's humorous
articles on netiquette. You can read more of these and general tips on
net use and behaviour in news.announce.newusers. Check it out!

========================== included article ======================

**NOTE: this is intended to be satirical. If you do not recognize
it as such, consult a doctor or professional comedian. The
recommendations in this article should recognized for what
they are -- admonitions about what NOT to do.

"Dear Emily Postnews"

Emily Postnews, foremost authority on proper net behaviour,
gives her advice on how to act on the net.

==========

Q: Dear Miss Postnews: How long should my signature be? -- verbose@noisy

A: Dear Verbose: Please try and make your signature as long as you can. It's much more important than your article, of course, so try to have more lines of signature than actual text.

Try to include a large graphic made of ASCII characters, plus lots of cute quotes and slogans. People will never tire of reading these pearls of wisdom again and again, and you will soon become personally associated with the joy each reader feels at seeing yet another delightful repeat of your signature.

Be sure as well to include a complete map of Usenet with each signature, to show how anybody can get mail to you from any site in the world. Be sure to include Internet gateways as well. Also tell people on your own site how to mail to you. Give independent addresses for Internet, UUCP, and BITNET, even if they're all the same.

Aside from your reply address, include your full name, company and organization. It's just common courtesy -- after all, in some newsreaders people have to type an *entire* keystroke to go back to the top of your article to see this information in the header.

By all means include your phone number and street address in every single article. People are always responding to Usenet articles with phone calls and letters. It would be silly to go to the extra trouble of including this information only in articles that need a response by conventional channels!

Q: Dear Emily: Today I posted an article and forgot to include my signature. What should I do? -- forgetful@myvax

A: Dear Forgetful: Rush to your terminal right away and post an article that says, "Oops, I forgot to post my signature with that last article. Here it is."

Since most people will have forgotten your earlier article, (particularly since it dared to be so boring as to not have a nice, juicy signature) this will remind them of it. Besides, people care much more about the signature anyway. See the previous letter for more important details.

Also, be sure to include your signature TWICE in each article. That way you're sure people will read it.

Q: What does fubar stand for?

A: It stands for you, dear.

: Your opinion. WWW improves by the month , year and so on. Your ST is not
: capable of doing what we PC and Mac users have been doing for awhile...

If you really want to use the Web (or indeed *any* internet stuff) then IMO the best platform is a un*x one - harder to set up, but much better in use. Netscape on X is the best web browser I have seen (over Mac, Windows and various unix platforms), and if you want to set up a web server then those available for un*x are much better than the ones I have seen for the mac. I speak from personal experience here having set up web pages on both machines.

While graphical WWW browsing on the ST is only available on the ST with MiNTX/Chimera and therefore is only in monochrome, it's unfair to compare the ST with modern macs and PCs. You can run Linux or NetBSD with XFree on a PC and get nice web browsing - but you can do that on the TT/Falcon now as well.

The only Mac versions of un*x are commercial, expensive ones. In fact AFAIK the only freeware un*x-like OS on the mac now the the MacLinux project seems to have died, and the only one ever on general release, is MacMint. Interesting that. It's also way behind the times, being only v0.95 while we're now on 1.12h3.

ATB,

Martin

Source record: 166650

I've been reading this thread for a while now and I feel I should add a little to the argument.

I am a Network Manager of a large PC network. I run MS-LAN manager as my main NET OS with the server running OS/2 and the stations running DOS and Windows. Typical applications running on the stations are usually MS Apps such as Word, Excel and the likes.

At home I have a 486/25 PC with 8Megs of Ram 1.3Gb Hard disk, Sound card etc... The OS's I use on it are

LINUX (UNIX Based OS)
OS/2
DOS
WINDOWS (More a bolt on botch than an OS)

One other thing. I also own and regually use my 2meg Atari ST. It's also got a Hard Disk.

Now let me make a few points. LINUX for the PC is great. OS/2 is wonderfull. DOS is erm... well usable. And Windows??? ARGHHHHHH!!!!!! The worst bit of code ever written. It's baddly bugged, slow and inherintally unstable. The fact that I have to run this over my network is very disapponting. When you use more than 60 PC's each day you soon realise how often Windows crashes out. My one piece of advice to all Staff and Pupils at my School is SAVE SAVE & SAVE AGAIN!!! You never know when the next GPF or UAE is going to happen (except for soon).

My ST on the other hand crashes erm.... .... well erm.... I'm not sure actually. I'm sure it's crashed sometime... i think.

Though to be honest I don't think we should be arguing the old 'My Machine is better than yours'. I don't see the point. I use all sorts of computers in my work. From RISC Based Acorns, UNIX Boxes, PC's, ST's, MAC's and they *ALL* have their good and bad points. I use My ST for MIDI & DTP, my PC for games and OS dabbling. I use them together using the good points of each allowing me to be more productive.

Oh the subject of the various markets though I do have strong opinions. It's strange that the ST should suffer from lack of support while I feel the PC gets far too much. Well to be more exact, far too much form MICROSOFT!! The grip hold that MS has over the PC market is a bad for the PC as the lack of support on the ST. MS does not develop products so that they may produce the latest 'Hi-Spec' software for us the public. MS is profit driven. You could argue that profit is the point of business but MS has become obsessed with control of the PC market. Stamping out ALL competition and making large sums of money. How can this be good for the PC user? Support for OS/2 Warp

is poor. IBM don't have the same 'clout' that MS do. This will eventually result in less end user choice and I strongly resent this. Thats why I try to use other OS systems on my PC's. So I may aid the passage of the lesser known into an MS dominted world. I only wish more PC users thought that way. If they did then perhaps prices would fall and our choice would increase. Windows 95 is *not* new. The coding concept involved was originally developed and used on UNIX back in the 60's & 70's. UNIX has been Pre-emptive, multithread multitasking for severall decades. Wow PC's have caught up at last!

On the ST though we have a wonderfull platform that few people seem bothered to support or develop. Perhaps our problem is the attitude of those who don't seem to enjoy choice. As much as I would like to see choice on the PC software & OS market. So I would like to see choice in the the range of computers avaiable. By people abandoning the ST and moving over to the PC we are moving towards and single computer market. How could this be good??

Let's do our best to work together for the computer industry as a whole and not get caught up 'Mine's better than yours' arguments. They waste time, reduce choice and cause hostilities. We are all computer users and the end of the day are we not?

Regards Gavin.

eh, usually when atarians complain about support, they complain about
lack of support from Atari (the company), not from the users in this
group. In fact support from Atari is non-existant, and Atari Europe
will be non-existant in a few months (I heard that Atari Europe, which
has office in Holland, is about to stop all activities and all employees
will be sent home...)

1736. Falon Owners List

Newsgroup: comp.sys.atari.st
Date: 1995-04-28 00:00:00 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <3nr7hr$n01@dux.dundee.ac.uk>
Source record: 166652

If you wish to receive a copy and/or subscribe to it please email me.

To be put on the list simply complete what is below and send it to me.
The idea of the list is NOT to compete with any other groups, but simply
to provide a list of those who are available via internet email. It is
suggested that you also subscribe to Falcon FacTT File or similar. If
you wish to also get in contact with other users who are not available
via email.

Rod

Message-ID: <3nrfa0$j99@news.duke.edu>
Source record: 166656

Al Fasoldt (alfasoldt@aol.com) wrote:
: Thanks for the help. I've been using ICD software since before the ST was
: introduced, and it's installed properly. The problem is not on the ST but
: on the TT. MagiC crashes as soon as there is any disk activity. Under
: AHDI, MagiC runs perfectly on the TT. This is ICD Pro 6.2.3, as I recall
: (a guess).

: I installed Tcache with the latest version I could find of AHDI and I'm
: happy.

: Al Fasoldt, Systems Editor, Syracuse Newspapers

I had comparable problems too. After booting up the system occaisionally
stopped and a hardware reset was the only way out of it.

In addition, when using Tempus Word pro I had reproducable problems using
certain graphic procedures.

After replacing ICD pro with AHDI everything worked fine together (Magic,
Ease, NVDI 3.0) and I had never any problem again.

Hi M,

> is this mag distributed in the Netherlands?

No! I just got an email from Richard Karsmakers (UVK), and he says nothing has been set up yet. I think you'd better yell about it - someone *has* to distribute Atari World in the Netherlands too!

Is the mag good? No, it's *brilliant!*

There was a program called Sam to Disk (or something similar) on a
ST Format coverdisk. I've got it somewhere but I've never used it
'cos I lack
1. A hard drive
2. A sampler
3. Musical talent

If your interested I'll try and find it.

: To the average Atari user PC clones are to hard for them....!!!

I'm working with an Atari, several PC's with DOS and Windows, a PC with Linux
and two IBM-workstaions with Unix. So it's not right for me, that a PC clone
is to hard for me ;-). But working with Unix and TOS are two very different
things. Both have advantages and disadvantages. But comparing DOS or Windows
to these systems, PC's are always bad. It's very silly making things harder
than they should be. E.g. try programming a PC, you always must have the memory
managment in mind. But all PC-user think working with a computer must be hard
or else it isn't a real computer. Think before you state something like that.
Not the human has to fit to the computer, the computer has to fit to the human.

1746. ANN: Shoestring Computers

Newsgroup: comp.sys.atari.st
Date: 1995-04-28 00:00:00 UTC
From: DOMINGO@news-feed.delphi.com
Message-ID: <3nqb9p$6bd@news2.delphi.com>
Source record: 166662
Cross-posted to: comp.sys.atari.announce,comp.sys.atari.st

** ANNOUNCE ** SHOESTRING COMPUTERS ** ANNOUNCE ** SHOESTRING COMPTUERS **

History: Allow me to introduce myself. My name is Domingo B. Alvear, but most people just call me "Dom". I have been using Atari computers since 1980. My first computer was the venerable Atari 800 with 48K, an 810 disk drive, and a 410 tape drive. Since then I've owned and upgraded various 400's, 800XL's, etc. I upgraded to a 1040ST in 1986. I currently own a 520ST, a Stacy, and a Mega ST. As you can see, Atari computers are my passion. I find that they still offer the same ease of use today as they did when the first ST rolled off the line.

Purpose: I believe that many Atari users have the same love for Atari computers as I do. Even though Atari Corporation has gone back to its roots, that doesn't mean our computers are now expensive doorstops. I use my computer every day to write letters, balance my checkbook, e-mail my friends, access the internet, etc. I know am I not alone. So what does Shoestring Computers have to do with all of this? Since we all can't afford to go and buy a new computer, upgrading is the only option. Shoestring Computers is here to accomplish that goal. If you are looking to upgrade your computer whether in mass-storage, RAM upgrades, CD-ROM drives, or acceleration, Shoestring Computers hopes to fill your need with the best products available at the best price with fast and friendly service.

Product: Currently Shoestring Computers has available SyQuest 105MB removables, NEC CD-ROM drives, and Quantum 540MB HD's. ICD's AdSpeed and Fast Technologies' T-25 can be installed to give your computer a speed boost. Various RAM upgrade paths are being investigated and will be available as well.

Growth: As a small, part-time business, Shoestring Computers has limited resources. With your support, I hope to build Shoestring Computers into a place where Atari owners can go to keep their machines running well into the future. Products will be added as the demand deems necessary, and new products specific to the Atari line are already in the beginning stages of development.

Contact: Shoestring Computers can be contacted through e-mail at the addresses listed below. In the coming months, a page on the World Wide Web will become available. Please send a short e-mail message if you would like to get a monthly online newsletter with prices, specials, and new products.

Closing: Thank you for taking the time to read this announcement. Your Atari Computer is only as useful as you make it. I would like to help in whatever way I can to insure that your investment remains valuable to you.

>on the percentage of recorded sales to and warranty registration cards
>received from users of both camps (data from myself and other IAAD
>members). The older units far outnumber the F030. Facts, not conjecture.

I know what you'd say. But you still don't get it.
Perhaps there is a large market for ST/TT software right now, but what in
the future. As i've said so many time, the future isn't based on ST/TT
machines. If you develope anything for these machines today, you see
people jumping from ST/TT and directly to another platform, cause there isn't
going to be software for the ST in the future. Even more you'll see Falcon
owners changing to another platform as well. And where does this leave
the Atari market then ? (I wonder why i keep saying the same thing all over.
You simply refuse to understand).

>>So now i'm threatening you Hutch ? In what way ?
>
>In the same way that our old friend Roger does (two peas in a pod?).
>You both keep telling us how you are going to buy a PC some day and be
>done with the Atari because of this or that complaint. Sorry, but that
>sounds a lot like a threat from a little kid who didn't get his way.

I never said i'll be done with my Atari. If you're going to quote me, then
stick to the truth. I said i get me an PC, and then things just has to happen
from there. I got my PC now, and first i'm going to use it for Internet,
(and perhaps playing a few games as well). Thats the only plans i've had
for my PC. But i can't say whats going to happen in the future. Perhaps
2B manage to create their Magic for the Falcon, and perhaps even more
software will arrive, but untill then, i think i'm well covered with some
Atari and a PC machine.
I also said i'm getting sick and tired of all this shit around Atari software,

but thats not any news at all. Beeing at this platform for 9 years, i know how it's like not to get the needed software. 2B isn't just a single case in this matter.

>
>>You don't give a damn in anyway, so why do you feel a threat.
>
>Wrong again. If I didn't care I would just ignore your incessant
>ramblings. Oh, only that I -could- just ignore you. What bliss. ;-)

Well, i never asked you to agree with me. I don't mind people who don't agree with me. Thats the whole idea of having a discussion. But i do mind when people don't even understand the meaning of my saying, (understanding the meaning and agreeing isn't the same). It could be because of the language, but other english speaking people havn't got that much problems with my english, so i doubt that.

And perhaps i am just a little kid who doesn't get it my way Hutch, but if thats the case, and with your statements, then i see no reason to look forward beeing an adult.

I'm not somekind of spokesman for the Atari people here in scandinavia, but with my contact to alot of them, i feel i have a good picture of whats needed and whats isn't. This should be something even you can understand.

Well Uwe, then stick to your ST and pray to that there'll be software in the
future. Cause the Falcon people are skipping their computers if they don't
get any software. And while the Falcon people are dissapearing, alot of
ST people are going away as well. So were does that leave you ? All Alone!

I'm wondering Roger, what on earth are you doing here in this area ???

In about every message posted by you you mention the heavenly benefits of the PC and still you are reading Atari stuff... Why ? Are you having second thoughts, is there too little action in the PC world ? Problem with PC's is that they are just no fun ! If you see through the colorful games/windows stuff it's just a pathetic piece of junk ! It's a garbage collection of old standards and kludged systems put in a chrome plated box with a shiny warning label 'Intel inside'.... (they should place Intel behind bars just for the fact that they create processors which produce so much heat that you have to cool them down with fans, talking about waste of energy/power..)

Hi Bob.
I have no idea if Jekyll is available for PCs. I also haven't been able
to contact my friend with the Falcon to see if it works on that either.
I'll keep trying 'though.

My .sig file is done with Figlet. Good and easy little program with lots
of different fonts available. It's on ftp sites. Get the figletst.zip
or .lzh or something, not figlet.*

1757. Re: Available Support...

Newsgroup: comp.sys.atari.st
Date: 1995-04-28 00:00:00 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HPVVVLSF6QAIDW27@SNYONEVA.CC.ONEONTA.EDU>
Source record: 166673

Anyone who has been an ST or Falcon owner for any length of time knows that Atari doesn't suport its products (can't and won't) aside from warranty issues.

Others here have pointed out that there's no shortage of friendly and informative user support on the internet and in user groups and with this I agree.

However, unlike many other platforms, many users are still on their own. In many areas of the world - particualrly in the U.S., there are only a handful of Atari dealers left and about as many commercial ST developers.

The situation doesn't bode well for novices who need their hands held regarding fixing system problems and finding/running certain software.

In this respect, Atari support is non-existant. The ST community though filled with creative and talented people is dwindling fast and at times it seems as though the ST will be doomed a pathetic existence akin to the likes of TRS-Color COmputers and the TI-994A...

I remember a time when there were half-a-dozen glossy ST mags and several large ST dealers in my area. Now there are neither...

Ari

1758. What ever happened to Crack-Art?

Source record: 166674

Hi all:

I'm curious as to what ever happened to that excellent ST paint program Crack-Art? The last version I saw was v1.36.

Is it still supported? I was also wondering if anyone knows the authors and their plans to port the program over to the PC. While the PC has alot of excellent software - its selection of usable DOS based gfx programs stinks!!!

Thanks.

Ari

: It refuses to do anything with LaTeX!! How do I get TeX to use the LaTeX
: package?
Use "tex &LATEX file.tex". Note that you can substitute any format name
for LATEX.
: And How do I set the XDVI fontpath ok to use xdvi along with TeX?
Can't help you there, although I too would like to get X running on my
machine.
: (I have to convert the .dvi files with dos2unix to view them, is this normal?)
I don't think so...DVI's are binary files and as such shouldn't need to
be converted.

Nope - I'm right and you're wrong ;-)

The SF314 was the 720K drive and the SF354 was the 360(ish)K drive. I used
to own a SF354 back the bad old days. I still have the manual for it!

:-)

Roland.

@CiX

PS

> Any historical Atarians confirm or deny??

I *am* an historical Atarian! Bought my STM+SF354 in 1986! :-)

But note - Linux is not going to run on a MSTE even *with* an FPU. Its
needs a proper MMU as well - and this normally means a 68030.

:-(

>
> Now I would like to get 115200bps from my TT's Serial 2 port rather
> than the poor 19200 I am currently running SLIP on; otherwise using

Well I've managed this. This is the connect script I use:

```
#stty 110 < /dev/modem2
u:/etc/ifconfig lo0 addr 127.0.0.1 up
u:/etc/slattach -p cslip -s 115200 -t /dev/serial2 -r 100.0.0.3 -l 100.0.0.1
mtu 2000 &
u:/etc/route
u:/etc/portmap
u:/usr/etc/inetd
u:/bin/mountd
u:/bin/nfsd
```

100.0.0.3 is my PC
100.0.0.1 is my TT

These are not 'real' IP adresses of course - but then my net is not
conencted to the internet.

The '#' out stty line can be used to set the speed to 115200, but I found
that slattach take '-s 115200' just fine. Even better than the way Linux/pc
does it.

Also note that the 'mtu 2000 &' on the line after slattach is a
continuation of the slattach line and not a new line.

Finally the last few lines are to do with NFS (Network File System) - and
aren't necessary for X.

> the usual friendly MiNT system crash report, i.e:

But I don't get this. :-(

> Shouldn't the HSMODEM patches be included in MiNT, together with a

Would be nice.

> flag that enables the high speeds, much like what Linux does?

Linux/68 doesn't cope with SCC ports anyway. If you mean Linux/pc - then
I know what you mean. MiNT-Net slattach copes with 115200 on its own anyway
- with needed 'setserial' or anything.

> If someone is reading this far, would anybody know where to get
> 'xhost'? Running X on my 6 meg TT is fine, except that the second

I thought I'd found it in the x11r5.zoo file but I've checked and its not there :-(Can't find where I got it from (though almost certainly phlem.ph.kcl.ac.uk). I can email you a copy if you are desperate.

> x terminal runs out of memory... Running plain X and doing the rest
> from my Linux/486 would be very nice, but without an access control
> utility I don't get very far... (connection to X display refused).

Yes this does work very nicely. A TT isn't a particularly fast X terminal - but quite usable. I'm currently trying the same with Linux/68 - but have only just got X up and running. Looks *very* much like MiNT-X though - and not really any faster :-(

Sorry I can't be much more specific - but at least I can tell you that what you are trying to do is possible.

:-)

Roland.

LOOK AT THE SCREENSHOTS!!!!!

Substation is NOT like Doom. There is NO texture-mapping (at least not in the
released screenshots.)

Yes, its 3d, first person perspective, but it is NOTHING LIKE DOOM. (sorry for
shouting, but I hate mis-information, it raises peoples hopes...)

I'm not saying that T-mapping couldn't be done, (L.of Valour looked quite nice
-
would have liked a Falcon version...oh well), but Substation does not do it.

Sorry to burst your bubbles...

Well, Geneva is not Mint compatible now, but I know Dan Wilga said the next
version definitely will be. I read this on GEnie from Dan himself, and since
Geneva is an AES replacement, it will be a better alternative than
Multitos (speedwise)...

Rich,

Xenomorph AKA Phoenix 2.0 Object Renderer takes advantage of it,
it increases phong rendering speed (with 16Mhz version) nearly 5-6 times or
more. Raystart incidentally does NOT support a math co-pro, the amazing thing
though is that even though it doesn't its raytracing speed is still very
impressive.

Chronos-3D keyframe animator takes advantage of a math co-pro,
cyber color, anm-link, genesis galatctic toolchest, metamorphosis 24 (morpher),
prism render, render for sculpt...they DO happen to be Lexicor products ;)
but that is because I know them best *grin*

I am sure math applications take advantage of it, such as Rieman II
and the likes.

```
g> Does the above mentioned game run on Falcon? Does it need Backwards
g> -program in order to run?

It works on Falcon without Backwards. Although it has a little bug, which
is caused by 4 megs of memory, not by Falcon. The game crashes if you
move your mouse pointer outside screen area. Use a Ramdisk to reduce
memory to 2 meg, or backward to fix this !

HLW>LiNUX doesn't run on the ST/STE. Only machines with a 68030 CPU with
HLW>68882 FPU or better (ie. Falcon/TT/Medusa/Eagle). If your ST has a
HLW>68030 card installed with FPU, it should run though.

The actually available version of Linux/68K supports without any problems only the TT! Falcon & PAK/3 have some problems (e.g. TT-fast-ram & SCSI) but it also works considerably. For the Eagle i know, that there are still a lot of problems, so until now, only a ramdisc based version of Linux/68k works.
I can tell you from my own experiences on my Medusa-Computer that it works, but reading or writing from the SCSI-Bus don't work. It seems like a hardware bug :-(There are although problems with floppy-drives, but I think, if you have implemented a VME- or the Counter-Card it will work.

If you try Linux/68K on PAK/3, EAGLE or Medusa it's most important to use an up-to-date kernel, in the moment 0.9 pl5 including patches 1 - 19! You can find this kernel and a lot of other stuff at ftp.phil.uni-sb.de in /pub/atari/linux. Unfortunately on this server are restricted limitations during the main business hours, so I will announce here another server, where you can get an up-to-date bootstrap, kernel and ramdisc and the official patch-archive from Roman Hodek up to patch 19, but nothing else! These things you can get via anonymous ftp from wctc6.chemie.uni-wuppertal.de (132.195.9.135) in /pub/Linux68k.aktuell/.

Why not for gods sake? Don't you get it into your head?

MagiC3 comes from MagiC2, which doesn't run on Falcons. So the ST/TT version
was finished earlier. Period. And ASH want to make some dough, so what?

The SF314 in it's numerous variations is a 720K DSDD drive. The
360K SSDD drive was the SF354. You'll have to ask Atari why the SSDD had a
higher number even though it was of lower capacity and came out before
the SF314! ;)

B > interface that was later used on the Atari ST. Digital
B > Research was in fact sued by Apple over the "look and feel" of
B > GEM on the PC because it was so similar to the Macintosh.

I know the fact that Apple sued the pants off Digital Research
for GEM, but I wasn't aware that GEM for the PC was released BEFORE
the ST was. I thought that the Tramiels decided on GEM being in the
operating system while GEM had still been in development, and was
released BEFORE PC GEM. So I could be wrong on that point.

Well, at least I can say one thing that won't be in dispute - PC
GEM (after Apple's required "crippling") was a nutted version of
what ST GEM would ultimately prove to be. But then, even nutted, it
was way more of an operating system than Windows/DOS will ever hope
to be :)

(See, Roger? Even I can admit that I can be wrong - not like
you)

... Microsoft is the QUESTION - and the ANSWER is NO!

H > does think the best PC operating] system is Windows NT).

H > I hope Bill Gates doesn't read this newsgroup or you may have
H > put Darek out of a job :-)

To make sure that Darek gets his fair shake, he also thinks
System 7 on the Mac is also not so hot as well - and that Apple has
been misleading PC users in their ads with greatly inflated claims
over its capabilities (an opinion that I do not personally agree
with, BTW, having used Macs myself for projects and genearl fun,
albeit my brother's Mac. At least that'll save me from being flamed
by Sinclap :))

This came from straight from Darek, BTW, when I was helping
Computer Direct set up next to him at ACE '95. Like him or loath
him, he's quite a character and has some great confidence in his
abilities. Even if he offends Bill Gates with his comments about the
products, Mr. Gates should keep him on - think of him as a "reality
check".

S > Funny the MindSet won a award, the Atari did NOT, so Please
S > make comments on thing that you know about..!!....

Once again, Roger - where is the Mindset NOW? Howcome nobody in this conference has heard of it other than you?

I know that for its time, the Atari ST was considered revolutionary - must've been if they sold more computers than the Mindset. Which certainly made it more successful than winning some nameless award (BTW, Roger who gave the Mindset the award? Are they credible?)

> Wait, I know how you'll reply to this one - "those journalists

Odd - can't used the mouse at all on my Falcon and unless I turn the cache
off the sound is even cruddier than on an ST.

: (not a browser!), images shown only in mono.

I'm willing to put up with this :-)

: Haven't tried it out yet, but I will... ;-)

It's quite nice, although it can be rather slow. The only really annoying thing is that it assumes ASCII files are of the DOS CRLF type - which is annoying for me because the files on my Unix-based home page are of the unix type (surprise!). It means I have to go through and convert them before taking them across to my account and vice versa.

Maybe the next version will correct this :-)

ATB,

Martin

Source record: 166560

What is the last possible date your computer / operating system allows? It just occurred to me that the Mac clock's options expire on December 31st 2019 (at which point we're supposed to switch from linear time to cyclic time, 'cause the next date will be January 1st 1920). Is this just another case of randomly planned obsolescence?

What's the verdict on your computer system? I thought I'd run an informal survey on this matter.

Please respond by e-mail and state the name of your system.

I will send the outcome to all respondents.

As far as I know, Alternate Reality used straight bitmaps for its walls,
not "Texture Mapping" which is FAR different. In addition, AR had only
90 degree walls... a true texture mapping game with full freedom of movement
in any direction at any angle would take far more CPU resources to map.

You're describing a *PELTIER-element* here.

>gets very cold. I was wondering if anyone knew about these litt;e
>devices - glue one to the CPU and another to your hard disk and
>you won't need any annoying fans.

You still have to remove the heat from one end of the element - by a fan.

As I've said before, in the common ST/TT/ and e-models, there is no single chip which gets THAT hot. No requirement for this amount of cooling.

In the Mega 2's and 4's the fan mostly cools the PSU. And slightly lower RPM of the fan will give the wanted effect, less noise but still sufficient cooling.

And I would NEVER stick such an element onto my HDD. This would cool down only a very pinponted space of it and the rest would still be warm. That could cause some stress within the material and therefore probably isn't the best of ideas.

The newer drives don't ger very warm any more. IMHO no need for cooling at all.

Bye.

Can someone tell me how to decompress a file with the extensions .g .gz .tar
and suchlike things. I've been told a few different ways such as just typing
in the filename without the extension will cause the file to be automatically
unpacked before being ftp'd. Every way i've tried does not work.
So is there an unpacker for these filetypes on the Atari or does anyone
know of a way to decompress them before i d/load them.

Maury:

I agree that the early ST's had some reliability problems - I had one of the first TOS in ROM ST's and I had alot of problems with the TOS ROMs unseating every now and again. However, with only moderate care for my components, my 520ST worked flawlessly for over 5 years of daily use. Overall, I've found the reliability of Atari hardware to be better than most other computer hardware I've owned.

Anyway, regarding some of the issues you raised:

ST's Video - it was indeed a form of local bus video. Yes, it used DRAM for it video but that was because it used RAM from the system to store its video. However, unlike CGA equipped PC's, the ST was able to update the screen and the CPU at the same time. This combined with the ST's efficient screen ram arrangement allowed for VERY fast graphics (i.e. lines, boxes, simple blits). The 1985 Mac+ didn't even have color like the ST and due to its video arrangement was up to 20% slower than ST. Let's not forget the ST's mono mode gave 20% more screen space than the Mac's screen either... :)

ST's disk drives - they used DMA (i.e the WD1772 FDC worked with the DMA chip for reads/writes). As a result, the ST had the some of the fastest floppies at that time and for many years to come. Because they used MFM technology and an MS-DOS compatible format, they were able to read many types of disks the Mac+ couldn't. The Mac+ also used variable speed floppy drives that resulted in slower floppy access.

ST's Sound Chip - certainly not the best. It was in fact the same chip that was used in the Colecovison game system. The C-64's SID was better but the Yamaha/GI chip used in the ST had stereo capability, ad noise generator and was still better than the Mac+'s 4 voice tone generator and much better than the polyphonic chip used in the IBMPCjr.

ST-s Hard Drives - for a long time, the ASCI HD interface in the ST delivered very good HD performance. It dusted many circa1985 HD equipped PC clones and destroyed the HD of the 1985 vintage Mac+...

ST's ports - sure, the Mac+ had them built-in but the Mac didn't use INDUSTRY STANDARD ports! This meant that you were locked into Apple hardware or expensive 3rd party add-ons. The ST had built-in Centronics, RS-232 serial, and Atari compatible joystick ports... :)

ST's interface - compared to the Mac+ it was childish but the ST didn't lock developers into anyone standard way of doing things either. Plus, GEM was available for the PC and it was thought that many applications would be available... Also, GEMDOS was very similar to MS-DOS so it allowed PC applications to be ported over very easily. All in all, GEM wasn't a

bad hack in 1985 - considering it was written in C and put into a
machine that cost over $1,000-$1,500 less than a comparable Mac+!!!! :)

Oh yeah, one last thing - the Mac was under development by Apple for many
years - the ST wliterally designed from scratch in less than a year!
It took 4 months for Atari to prototype 4 custom chips which made up the
core of the ST. All in all, considering the times and the financial
resources of Atari in 1985 this is pretty impressive.

Just my two cents...

: a fast, 16bit CPU(the 68000), a reasonably stable windowing OS and GUI (GEM),
: local bus video (for very fast graphics), mouse support in hardware (not
: under software like in the PC), built-in I/O ports, a very fast HD controller
: architecture (faster than 1985 PC RLL), fast and flexible floppy drives that
: used DMA, an MS-DOS compatible disk format which enabled STs to exchange
: data with the outside world, an OS (GEMDOS) that was very similar to DOS 3.2
: so that developers could port applications very easily, MIDI ports, and
: a decent sound fx generator.

Yes, you're right. In 1986 ST was an extremely attractive alternative to
any PC. The PCs of that time... Well, the word "awful" might tell it all.
I was about to buy one then: Kaypro XT. It costed twice as much as a 520
ST, with 4.77 MHz 8088, monochrome graphics, and 360 kb floppy drive. How
many times I've congratulated myself for NOT going for "compatibility"
and that horrible metal monster =-) !

: I was 14 yrs old when the ST came out and was using both an IBM PCjr and
: a Leading Edge model D. I had some money in my pocket that summer so I
: bought the ST because it was so vastly superior in terms of features and
: performance. PC's were still using CGA for gfx and the poor old 8088 was
: really starting to show its age. I didn't go back to the PC for almost
: another 8 years, by which time I had owned a 520ST, a 1040STe w/HD, and
: a Falcon 4/85.

Almost the same history: 520 ST (with RAM TOS 1.0! ;-), Mega ST 2 w/HD,
Falcon 4/420. And lots of accelerators and other stuff, of course!

: I only came back when the ST series was starting to show its age - when
: I needed to run certain programs for college classes, when I wanted to
: play games that were only available for the PC, and when I figured I could
: make more money working on game projects than I did on the ST line.

Well, I've myself realized something while wondering why so many of us
are abandoning the Atari world. For me, the working environment of GEM
(especially TOS 4.x) means more than the obvious advantages of PCs and
Macs (more horsepower, more graphics, more users). I just don't enjoy
using Macs and PCs, like I really enjoy using my Falcon. For me, those
machines are powerful, yet only tools. I may do my work with them every
now and then, but it's always great to be back home - and start doing
things the way you *want* to do them!

If I tried to make money with computer, I'd probably start thinking the other way. Maybe.. So, I guess, those of us, to whom Atari doesn't mean very much personal - and who don't enjoy being "lonely riders", will leave us sooner or later. And people like me, to whom there really are no enjoyable alternatives, will wait for better Atari-compatible computers, without much chance of abandoning them.

PC is a computer of cold business, and Falcon is a computer of emotion. Different computers for different people; that's how it was in 1986 with ST and PC - and that's the way it will be.

: Probably my biggest gripe about the ST series when I was an owner, was that
: Atari locked you into its 320x200x16 low rez mode. Hell, my PCjr had
: the same gfx modes! Had Atari added a 256 color mode with the release of
: the Blitterized STe series, I might of kept my Atari. The TT had VGA
: video capabilities but the machine was FAR too expensive and the Falcon's
: are under-powered (much like a 386SX under Windoze).

I don't see Falcon quite that under-powered, except when trying to do some raytracing :-(. It handles most programs quite well, and some of its applications are actually very fast (even without using DSP). Think of Apex Media, Calamus, many graphics prgs, and especially music software. NVDI is a must for Falcon, but then again, it is a great piece of software. Very impressive Atari software are also KOBOLD (unbelievably fast file copier!), ECOPY (a state-of-the-art disk formatter and copier), HARLEKIN (multi-accessory with very useful functions), CONNECT terminal sw, SPEED OF LIGHT picture viewer, GEMVIEW, DIAMOND EDGE hard disk defragmenter/repairer, ... Not forgetting SELECTRIC and UIS 3 file selectors =-) ! A computer is as good as is its software, isn't it? Using those before-mentioned things, PAPYRUS word processor, and CUBASE AUDIO sequencer/hard disk recorder, one might say that Falcon is quite a nice computer, after all !

: Still, while I do enjoy my PC, I do miss my STs and the many fond memories
: I have of the machine. I might even pick one up again as my finances allow.

It's funny to see how so many of you see ST as a distant, fond memory - while for so many of us others, Falcon and the other new machines make Atari computing living reality - not memories =-) !

Do you happen to remember, how ridiculously slow Mac was then (and is today,
too - because of its slow OS..) ?

: > a reasonably stable windowing OS and GUI (GEM),
: And I didn't realize how amature it was until I tried out a Mac.

You must be joking, are you ?

: > built-in I/O ports
: Like the Mac.

Bullshit (sorry)! Mac was known to have such non-standard ports, that
one had a VERY tough time trying to use his PC-disk drives, printers, or
almost anything with Mac... =-(Not mentioning the non-compatible disk
format..

: > a very fast HD controller
: The WD unit used in PC's all over the place at the same time.

Bingo! Bullshit again. I remember well, when a Finnish professional
computer magazine tested the Mac emulator for ST - and was quite
surprised to find out that Atari's slowest MFM hard disk drive Megafile
20 (slow as hell!) performed in their tests *better* than their test labs
Macintosh II (a very expensive computer, then) with its big SCSI drive...

The conclusion: Mac had a very slow hard disk controller - but still
faster than most PCs with MFM controllers. Atari, with its over 1.2
Mb/sec. controller was well above the competition. Well, not all hard
disk controllers even today on PCs reach that speed ;-) !

: > MIDI ports
: The ST's one lasting grace.

It's your opinion alone.

: > and a decent sound fx generator.
: The sound chip was one of the things I hated the most about my ST. The
: C64's SID chip was at least as powerful.

...and the PC "beep!" ?

Sorry, but you just won a prize of "the worst arguments of today" !
Not worth writing in public (IMHO).

>> Actually I suppose the real question is - just what *is* active termination
>> - and how on earth do I tell it from the passive sort? ;-)
> A SCSI II active terminator looks exactly like a Passive terminator but they
>are normally marked as 'ACTIVE TERMINATOR'.

There was some information re. termination in the latest STR:

------------------------------cuthereplease-----------------------------

Active Termination:

An active terminator actually has one or more voltage regulators to
produce the termination voltage, rather than using resistor voltage
dividers.

This is a passive terminator:

TERMPWR ------/\/\/\/------+------/\/\/\/----- GND
|
|

SCSI signal

Notice that the termination voltage is varies with the voltage on the
TERMPWR line. One voltage divider (two resistors) is used for each SCSI
signal.

An active terminator looks more like this (supply filter caps omitted):

```
+-----------+
TERMPWR-----| in out |------+------/\/\/\/-------SCSI signal
| gnd | |
+-----------+ |
| +------/\/\/\/-------SCSI signal
| |
GND---------------+ |
+------/\/\/\/-------SCSI signal
|
etc.
```

Assuming that the TERMPWR voltage doesn't drop below the desired
termination voltage (plus the regulator's minimum drop), the SCSI signals
will always be terminated to the correct voltage level.

------------------------------cuthereplease-----------------------------

: you're using. But when person like Hendrik try to tell others about his
: experiences with a PC, then people, who know better, are entitled to correct
: this. Even though it's an Atari newsgroup.
:
:
As usual, Kim, you've got it back to front again.

Just because you don't have the same problems as Hendrik with PCs doesn't mean that he's wrong and you are right. What he wrote about were *his* experiences - not yours. I don't dispute that you may know more about them than he does, and that you've never been able to reproduce the faults which he reported. That does not make his experience less valid. I've never used a modern PC (I played with an XT many many years ago for about half an hour, then bought an Atari) so I can't comment on his or your experiences. However, the long running arguments between you and Hendrik, Bob R and James, and others, are what helped me to decide to buy a Mac to replace the ST rather than a PC.

Maybe not everyone gets the same level of grief from a PC as Hendrik does (or did) but I felt that if a machine needs as much understanding and specialist knowledge as the PCs seem to, then it's not for me. If you really want to argue about the various merits and demerits of PC platforms, either do it in a PC newsgroup or in e-mail; I, and I suspect a lot of others have had enough of it here. You made your position clear ages ago, now let it drop.
I agree with you that to all intents and purposes the Atari range (ST and Falcon) is effectively dead as a commercial proposition as general purpose computers. The ST is so far behind and the Falcon so poorly supported that they will now never be anything other than special interest machines. This is not to decry the capabilities of the Falcon or the efforts of the small band of dedicated programmers still working for them, by the way; it's being practical.
However, this doesn't mean we all want to read nothing but your opinions on how marvellous the PC is. Drop it and let us all get on with dicussing Atari and Atari problems.

greets to you too
bazza

Hello Hutch,

do you know if these drives have a 120 volt fixed power supply or a universal
120-240 volt unit. If the 120 volt unit then some of the cost may be the
conversion of the unit to 240 volt which does add cost from my previous
experiences.

Best regards
Mark

1812. SLIP OR PPP For atari 1040?????

Newsgroup: comp.sys.atari.st
Date: 1995-04-29 00:00:00 UTC
From: tim@perth.DIALix.oz.au
Message-ID: <3nsrii$8fc$1@perth.DIALix.oz.au>
Source record: 166585

HI,

I own an atari 1040ST with no hard drive. I was wondering whether SLIP
or PPP (including FTP, TELNET ETC.....) is available on one 720K floppy?
I am also interested in any info on SLIP or PPP for the atari's.

Thanks.

PS. Please email me.

Tim Middleton
tim@perth.dialix.oz.au

Has anyone actually used it? Apparently it has now been fixed so that
it will run on the F030. I'd appreciate any opinions. Its just that
if MultiTOS is anything to go by certain progs under Magic will be
very slow, or slow everything else down.

N > Should, ought, or actually _does_?

Not yet, anyway - but the next version (Release 004) will
support MiNT. I saw the demo of the 004 beta at ACE '95 on April
1st, and it looks pretty good.

Can't wait til' May 31st (which is when Dan Wilga hopes to have
the patch program ready for Geneva).

... Oh! Here's your problem... you had it set for evil.

>devices? Thanks in advance!

AFAIK this is what most people do. I've got four (count 'em!) SCSI hard drives stuck in an old (and really, really heavy) NCR TOWER case, along with a 200W power supply and an ICD AdSCSI+ host adapter. Works great, and there's a tonne of room inside, so I don't have any problems with heat.

I typical PC mini-tower case or a used full-size AT case would work just as well, but this TOWER case was free. I just had to take out all the old power supplies and PCBs (the TOWERs were 68000 and 68010-based UNIX systems many years ago).

1820. Network for ST using ARCnet cards?

Newsgroup: comp.sys.atari.st
Date: 1995-04-30 00:00:00 UTC
From: Koos_Kuil
Message-ID: <2fa3d234@f397.n282.z2.fidonet>
Source record: 166453

Hi!

We've got a new network on my work (Ethernet) and all old 8-bit ArcNet PC cards are unusable now so they are waiting to do something again.

I've heard that it's possible that they can be connected to the ROM port for setting up a fast network between Atari's and PC's.

Does _anyone_ have _more_ information about this? It would be very nice because they are cheap and good enough for use in Hobby environment.

A optional PC server isn't a problem, i can offer my 386 for this but maybe there are other options possible. It will be interested too what software which is required to make use of it (Novell compatible??)

Greetings,
Koos

Yes, I know this is an Atari group BUT...

My parents have an old PC which will NEED to be upgraded soon, however the software (WP) they are using is way out of date. As I have Papyrus on my Falcon I thought, why not get them to get the same thing, then I can use my files on their computer... Anyway to cut a long story short does anyone know when it is due out?

Rod

Still rambling on... and on...

>A few questions for starters:
>1. Say I record 2 separate tracks. Could I (preferably while the samples
> are playing) adjust the volume of the tracks independantly?

Yes, there are three "stages" of channel level adjusting: Graphical Volume
editing for each Audio Segment, Mixer Volume (automated sliders) for each
channel and Monitor output volume for each channel.

>2. If I have limited HD space, could I record 2 separate tracks, then, when
> I was happy with the volume ratios, mix them down to one track.

Yep. But if you mix two mono tracks into one stereo file, the space needed
in the disk is excatly same (1 min/Mono 44.1Khz = 5 mb
1 min/Stereo 44.1Khz = 10 Mb)

>3. If yes for #2, how many times can you mix tracks before signal quality
> degrades noticeably?

The signal quality does not degrade at all, as "ping-pong'in'" is entirely
digital. But of course you can produce distortion by making too heavy EQ'ing
etc. as in all mixing situations (also analog).

1833. Help with PowerUP 2 installation!

Newsgroup: comp.sys.atari.st
Date: 1995-04-30 00:00:00 UTC
From: contacts@mits.mdata.fi
Message-ID: <3o0b2n$4j0@prime.mdata.fi>
Source record: 166509

Problem with PowerUP 2 (Mk2 April94):

If you let the LED out from PowerUp 2 installation, should the
green cable be connected to +5 anyway? What about 270 Ohm resistor?

Could someone explain in detail the connection points of the hardware
switch (and when it is not needed).

Problem is, that the PowerUp 2 does not response to the CPX at all
(always off) or TOS-programs - the installation was made by a
certified engineer who left the green wire unconnected (he said it's
only needed for LED power) and ignored the hardware switch part (grey
cable goes only to the keyboard processor). The Falcon works OK.

I'll take the machine to him again after weekend, so please give me
some hints before monday, thanks!

Anyone?

I've used a lot of Macs, up to and including a PowerMac with 32Mb of RAM. While in many ways it's a nice machine, and _can_ at times be blisteringly fast (try out the demo application on the PowerMac which draws animated, light-sourced, 3D graphs at an amazing frame rate), in general I find that the Mac architecture doesn't seem to scale very well with increasing power of the subsystems. I've seen the specs for the PowerPC chip and I felt that the PowerMac was in general *much* slower than I expected it to be.

: > make me happy at all. And too many programs seem to have problems with
: > MacMagic, as well. Some people, besides, love MacOS - but I rather hate
: > it. It's as stupid as a cow. Easy, but stupid.
: Why? What part of the Atari OS do you like better? I can find
: absolutely nothing in the Atari OS that does not exist in the Mac OS. On
: the other hand, I can find HUNDREDS of examples of the opposite.

Well, I'm not sure about *hundreds* of examples. There are certain things MacOS is good at - particularly networking, res-independent graphics and long filenames that work throughout the system. However, it doesn't cater well for the 'poweruser'. For example, I have found myself stymied trying to do perfectly sensible import operations with ftp'd files simply because the type of the file in the filesystem is wrong. I wouldn't mind this, but for the fact that there seems to be no way to change the type from the desktop. In the end I had to do it from ResEdit, which is ridiculous. The Atari OS at least usually never stops you from doing things by taking 'user-friendliness' too far.

Besides, there is one thing in the various Atari OSs that I do regularly use that the Mac hasn't got, and that is proper, protected multitasking. As a programmer, I view this as important!

: > The REAL alternative may well be the Eagle. A German TT-clone, twice as
: > fast as a TT, and very easy to upgrade with 68040, or even 68060. Just
: The 68060 will never ship.

If the 68060 hasn't shipped yet (and I think it probably has), I think there's little doubt it will. A company does not spend the amount that Motorola has done on the 060, and release spec sheets and so on, and then leave it on the shelf.

ATB,

Martin

Get FTPOV. Its a hell of a lot faster and it's completely compatible...

RM> I selected box.pov (from the level 1 screens). My other settings
RM> were 2100k buffer and no multitos.

'Box' is a bit of a slow one due to that floor texture. Also, don't use the buffer option - it just starves POV of memory and doesn't speed things up (unless you trace to floppy disk).

RM> Is it normal for it to be this slow?

It's about normal. Remember - POV is a raytracer, not a renderer!

:)

TPH> Name just three of us who drool your titles ;-) ! You have some
TPH> spectacular programs, true. And we have things like Apex Media
TPH> Mac doesn't have. Two worlds, different worlds. No use arguing!

And Apex is staying firmly Falcon-only for the visible future. This way we
keep our userbase happy rather than depressing the hell out of them, and we
have opened a fairly unique market, which we are gald to say, is now
getting the attention of PC, Mac & Amiga users worldwide. We can only
benefit from this in the long term and it makes sense NOT to stick it on
the PC now unless Falcons become so obscure as to be impossible to obtain.

Even then, the Falcon is so much fun we will probably update it even then...

:)

Cheers,

Doug.

General! We have intercepted a coded Imperial message from the Pekka Hietavuo system!
TPH> houses have acted just like that when abandoning Atari- and Amiga
TPH> platforms. They have taken the A&A programmers out of their 68000
TPH> projects, and put them to make PC software instead in order to make
TPH> more profit.

This is exactly what happened - I was working at a software development house DURING this 'profit seeking' shift from the Amiga/ST onto the PC. They told us it was just an experiment to see how things went - but of course, it was more profitable to sell crap on the PC (since there were more of them) than it was to put some effort in and actually do something interesting on another platform. Needless to say, the PC became the norm - and you had to adapt to this or be ignored.

TPH> we really let the market decide everything, what'll we get? The
TPH> result from profit -orientered business thinking is this: no
TPH> alternatives anywhere. No Ataris. No different television programs.
TPH> No different newspapers. Only something that makes the faceless
TPH> "majority" satisfied, but doesn't make almost anyone really
TPH> happy.

When we formed BSS & started developing Apex for the Falcon, we got a lot of flak due to the fact that it didn't run on the ST or TT. We were told by many that it would not sell since it did not cover the entire range of machines and that there were not enough users to make it a profitable choice. Worst of all, the pressure was to drop it for the Falcon and develop it purely for the PC as it would sell more copies and in the process, become a more respectable product. What they were missing was that we intended to do a good job. Put some effort in, and write something WE would want to use when it was complete.

It worked better than we expected.

So far, we have outsold all expectations on the Falcon - and although the market is quite small, the market SHARE is much higher than we initially expected. We have a large number of professional users dropping their PC's for Falcons loaded with Apex, both in the design and cable video markets. We have people using Falcons in conjunction with PC's armed with 3D Studio so they can work with truecolour animations which Animator PRO can't edit. Even the newest incarnation of Autodesk's baby looks like it's going to be hampered by the speed of the Windows and although it looks really good, our customers are concerned that a Pentium running Studio Animator in truecolour will not be as fast as a 16Mhz Falcon with Apex!. There are even a few who are using the Falcon in preference to the Silicon Graphics Indigo2 workstation simply because they find the Falcon is easier to use -

even though it involves porting the images across and then back again afterwards!

Surely, all this has to count for something - even if it's just that there ARE some alternatives to a platform such as the PC.

TPH> I feel that we, Atari- and Amiga-users are mostly people who do
TPH> _NOT_ want to have a gray, uniform society where profits dictate
TPH> what we can buy and what not.

Yes, variety keeps evolution burning. The cease of growth is the first step towards certain death. I think Darwin or somebody equally qualified said this first, and I have no reason to doubt it...

TPH> but, above all, they must be able to satisfy all kinds of needs.
TPH> Also minority needs. We'll get a very nasty world to live in, if
TPH> money decides everything alone...

Agreed. I would never consider completely ignoring a platform simply because I thought another one was better or faster, but the PC does cause me some irritation in this respect. It would make a fantastic competitor in a group of computer systems, but marketing and human behaviour has pretty much wiped out all but the Mac, leaving the PC to mould in a configuration not too far from it's original design.

TPH> doing. This very clearly is a fight for life, now. If people get
TPH> tired of what Atari represents (the WAY of computing it
TPH> represents!), and move to other platforms, then computing world
TPH> will be a grayer place tomorrow. We have to fight against that, or
TPH> buy PCs. Who wants to do _that_ ? Macs won't get most of us much
TPH> happier, I'm afraid. Some, but not all. So, this is war!

There is another sad story to be told here, the story of the fresh, creative, new programmers. Or rather the LACK of them.

When the Amiga and ST was commonplace, they were owned mostly by the younger members of our society. Lots of them played games, some of them mucked about with other stuff as well. A few got to grips with the machines and started writing programs of one sort or another, getting quite good at it - good enough to write software and games. At this time, programming was just that - you got out your programming language and created something. It was quite easy (if you knew what you were doing) and it was good fun in itself. These people became very capable at their trade and some went off into the world to do greater things.

However, since the PC (and Windows/OS2 etc.) has come heavily into the fray, the process of development has become more difficult, less fun, prohibitively expensive and in some ways altogether frightening. Anybody who has used something like Borland 'C' (not bad by PC standards) or WatCom (different kettle of fish) will know what I mean. When I have to write something on my ST/Falcon/Amiga I think - excellent, something new to try out. If I have to do something on the PC, whether it be Pascal, 'C' or worse - 80x86 assembly - I think - sod it, not again...

I wonder how this is affecting the arrival of creative new talent?

TPH> If "business" forces us to buy bullshit, it's time to say "no" !

Yup. But it's hard for many people to see it this way. It's been too long now since the rot started.

TPH> If I have to use a PC to get some job, I'll do it. But at home I
TPH> will use whatever I _want to_ use. And that's Falcon. That's our
TPH> own choice, whatever the business-brains try to decide =-) !

And long may choice last, whatever it may be!

:)

MG> to display any objects. (I got it of cnam.fr). The archive contained
MG> no documentation, so if there are any tricks to it, could someone
MG> please let me know?

EDPOV is not exactly EASY, to say the least. To say that it is bizarre is an understatement as well. I spent quite a while just trying to get it to load stuff up, but eventually worked out that it's internal resources for storing objects were not very clever. You have to select the maximum number of objects before you start, and too many will use up lots of ram. Also, it only really likes POV2.2. It was a bit of hassle getting it to talk to FTPOV2.1 (which I refuse to compromise on, due to it's much greater speed) as the parameters are a bit different.

If you didn't get POV (the Raytracer part) with it, then you are stuck until you do!

Anyway, it's worth battling with - but learning the POV language is probably a more realistic way to get results. Far more reliable in the long run, even if it takes some patience.

From: az822@FreeNet.Carleton.CA
Message-ID: <D7v01o.6zJ@freenet.carleton.ca>
Source record: 166521

I can't seem to copy any files larger than 5 or 6 meg. Most of what I wish to do is to back up audio files created in Cubase Audio or Logic Audio onto another partition of the same SCSI device that the original resides. When the file becomes larger than 5 or 6 meg, I get the error message that the output device is not functioning properly, or that the source file is corrupted. the source file is not corrupted because it plays back with no apparant glitches.
Has anyone experienced this problem, and if so, can anyone offer advice or a possible solution?
Thanks to any one who might be able to help

The Mac SE/30 was the first 68030 powered Mac, IIRC. From their you had
the IIcx, IIci, IIfx, IIsi, several Performa and LC duplicates, et al. All
the Centris and Quadra models are 040 powered and will run MagiCMac but
the new PPC-powered PowerMacs will not, at least not yet.

I don't know if it is a universal power supply (I doubt it) but it -is-
an external unit. Makes for more wires under the desk but for a slimmer
and cooler unit on the desktop. Good point, though. Buying a unit made
for the US market would be more expensive if you had to change out the
power supply. But if you wait for those built for the European market,
the cost differential should be much less.

The hard part would be waiting, of course. :)

1853. Minix Teradesk?

Newsgroup: comp.sys.atari.st
Date: 1995-04-30 00:00:00 UTC
From: Adrian Bridgett <apb25@cam.ac.uk>
Message-ID: <3nul5c$qqj@lyra.csx.cam.ac.uk>
Source record: 166529

A while (6 weeks) ago someone said that they saw a version of
Teradesk that could use minix partitions (properly I presume
rather than the 8.3 mapping that minix.xfs can do for all programs).
Does anyone know where this version is?

Thanks

Adrian

1854. Cubase Audio Falcon Questions

Newsgroup: comp.sys.atari.st
Date: 1995-04-30 00:00:00 UTC
From: ralunsfo@uncc.edu
Message-ID: <3nupjr$3o7@news.uncc.edu>
Source record: 166530

I've got some questions regarding Cubase Audio Falcon...I'd appreciate it if whoever uses this software could email me a response, so this could continue, as I'm considering buying it. I just need to know some things about the digital recording section.

A few questions for starters:
1. Say I record 2 separate tracks. Could I (preferably while the samples are playing) adjust the volume of the tracks independantly?

2. If I have limited HD space, could I record 2 separate tracks, then, when I was happy with the volume ratios, mix them down to one track.

3. If yes for #2, how many times can you mix tracks before signal quality degrades noticeably?

Thanks,
Russ

>It seems to me that PC owners find their computer is too hard for them!

So what would one of these totally clueless dweebs do if they mucked around inside their car's ignition system and totally messed up the system to the point where they couldn't put it right..?

Probably they'd turn to any one of thousands of auto mechanics and repair shops in their local area.

What happens if they mess up their IBM compatible computer..? Same thing.

Now, what about the poor defenseless new computer owner who's had an Atari system foisted off on them by some well-meaning zealot..?

If it breaks, they're totally screwed, because there's only a few places left in the world to get them fixed.

If they want software, they're almost totally screwed, because there are only a few places left in the world to buy software (or hardware).

If they need some kind of technical support, same thing.

(Remember, they're the same total newbies who would have otherwise bought an IBM system, and have no clue what the Internet is, or how to get here, and doubtless the local Atari user group is long since disbanded. If there ever was an Atari dealer nearby, they've long ago gone out of business from lack of support from Atari, or gone into a more stable marketplace.. like IBM)

That's not the way I *wish* things were.. I'd love to see an Atari store on every corner myself, but that's the way things *are*...

: Does anyone know where this version is?

For a start, minixfs on my system does not do 8.3 maping for all
programmes, unless you change the translation mode to make it do this.
All my programmes seem to work fine without translation, even though they
run in TOS Domain. What you are referring to is probably a
version of Teradesk that runs in MiNT Domain, therefor not getting the
8.3 mapping. It will almost certainly still require minixfs to run. On the
other hand, I recommend Gemini as being much better than Teradesk, and
Gemini runs in MiNT domain anyway...

Hope this is of some help

I think this is total BS. Most Atari users now are either hackers or people who don't need to know a lot about computers in general. Almost all of my friends who own Ataris also know a hell of a lot about Unix and PC systems. Just like I've seen mentioned here so many times before, these people who work with other systems every day *love* to work with their Ataris. It's definitely not because they don't understand the other platforms, either...

The 800 and the 520ST were two of the best computer products ever designed. Unfortunately Atari never really improved on the capabilities of these two machines until it was too late - XL's, XE's, 1040's, and Mega's were basically retreads.

Anyone who says the ST was not a big deal when introduced was probably dozing at the time - 1/2 the price of the mono MAC, cheaper and faster than the Amiga, beautiful color monitor, zero wait states, read IBM compatible disks. Not to mention the games that came out for it - Hex, Time-Bandits etc.

This is coming from a current PC user waiting for Microsoft to bring out a 32 bit operating system 10 years after Apple, Atari, Amiga already had one - jeezzz.

Actually, there are PC and Mac versions of TrueType. I'm not exactly sure what
the difference is, but SpeedoGDOS (and most likely NVDI) needs the PC version.
I believe that the same is also true of Type 1 fonts (PC and Mac versions).

A > 4 MB RAM are enough if you do not need Ease, you then have
A > about 1,5 MB free RAM for your Applications. 5 MB of free
A > space on your hard drive should be enough for the system
A > itself.

Thanks for pointing that out. However, I was going by what
System Solutions was recommending in their seminar at the ACE '95
show - they were running it on a Mac LC575 system with such a
configuration. The eight megabytes was not only to allow Ease to run
(which IMHO you'll probably WANT to run with MagicMac, it's so
wonderful an enviroment to work with) but also for room to run
certain productivity software or wish to make the most use of its
multitasking capabilities (and believe me, you'll want much more
free memory than 1.5 mB if you're wanting to run Calamus SL with
MagicMac). And don't forget you'll also still need room to run
System 7 and any desk accessories you may want/need in THAT
enviroment.

Same with the hard drive - you'll need at least that room to
start storing all your application programs on it (albeit to be
fair, one of the nice things about Atari software is the fact that
it's reasonably small, my setup of Calamus SL takes up 4 megabytes
of hard drive space, counting the number of fonts and documents I
have). And once again, you'll need that space to store System 7 and
any enhancements to it - as well as the Mac applications and fun
software which, quite frankly, most people who own a Mac will
probably want :)

Thanks for pointing out those things, though - I'm certainly not
a computer expert, so I do need to be corrected from time to time,
albeit not on an ongoing basis like a certain humourless individual
we all know here.......

... Answers: $1, Short: $5, Correct: $25, dumb looks are still free.

G > This afternoon I found a 520ST in a thrift shop (included
G > mouse, SF314 drive, some mystery-unknown name 5.25" drive, and
G > appropriate power supplies) This at all a good computer? (use
G > your own definition of "good computer" if you respond) ...at
G > all a good computer considering I picked it up for about
G > us$13.00? =^)

$13.00 for a used 520ST unit is not bad at all. And although
it's only 512K, you should be able to do a few things with it (read
on)

G > Is there any kind of built in self test?

unfortunately, no.

G > What kind of drive is the SF314? DD? HD?

if it's the original disk drive the 520 came with, it's most
likely a single-sided drive unit. However, you should be able to
replace it with a DD internal drive with very few to no problems.

G > What kind of boffo cool stuff can this puppy do? (and where
G > do I get started?)

At 512K, it's obviously NOT going to allow you to run the type
of software Atari power users get to play with (like Calamus DTP and
Logic 2 MIDI software). However, there is quite a bit of public
domain/shareware programs out there that will run happily in 512k,
including word processors, games, fractal generators, comms software
- even a few MIDI sequencers (make some good use out of those round
ports on the back of your computer). There are some good Atari ftp
sites at the University of Michigan and at HENSA for software.

You might want to get in touch with Toad Computers in Maryland -
they're one of the biggest Atari stores in the US, and they do mail
order anywhere in the world. Phone them at 1-410-544-6943 and ask
about their catalogue - if you've got a PC and WWW access, they have
a Web page at http//www.charm.net/~toad/. David and Jennifer Troy
are wonderful people who have helped me out in the past, and should
be able to give suggestions on the best ways to use your little
addition to your computer stable.

G > Where does the 520 stand among the ST computers? (and what
G > does "ST" stand for anyway? =^)

520 is the short form for the fact that the machine is set up
with 512K of RAM; ST stands for Sixteen/Thirty-Two, which is the bit

structure. Basically the machine is a 16-bit computer based around
an 8mhz Motorola 68000 chip.

Hope this helps - and have fun!

... So, Puddy-tat's not so bwave in Gwanny's microwave....

Ditto to that! I installed my current hard drive setup inside a
mini-tower case that sits on top of my desk next to the STe- inside
it is my current boot drive, an IBM WDS3100 100 meg drive; a Conner
40-meg drive (currently not in the SCSI chain, but my brother and I
are going to try to get both drives going on Monday), and an NEC
CDR-84JD-1 CD-ROM drive. The only other mods to it are an "Intel
Outside" sticker in the brand panel window, and a bumper sticker on
the case that says "ATARI SUPPORT? We don't NEED no stinking
support! :) Looks cool, very few problems. I mounted the 50-pin
Centronics socket to the outside of the case near the bottom with
metal screws so the Link II doesn't flop around when it's plugged in.

G > Of course not, we are totally unable to do so. Besides those
G > multi-parallel machines, of course. BTW, we can't build cars
G > either, that's why BMW bought Rover *sheesh*.

GOOD ONE!

G > Yep, and New Zealanders make anything they develop somewhat
G > sheeplike. I wonder what Jeffrey Minter would think of it, but
G > IMHO sheep are boring. As is - of course - Roger W. Sheppard.

Now, now, let's not tar all Kiwis with the same brush because of
the ramblings of one humourless, uninformed misanthrope (who himself
is a British expatriate, not a native New Zealander). Remember Steve
(the Anti-Sheppard) Wells also inhabits this conference as well.

LOL at the reference to Minter, though....

At school here, there are outlets in all the rooms for ethernet connections. Is there a way to use these with Localtalk ports? Are they compatible in some way, or are they the same, or what? Thanks in advance!

>Can I use a standard PC case with ST peripherals?

Yes.. that's a popular choice. The power supply in a typical PC case is more than adequete for anything you'd want to mount in the case, and there should be plenty of mounting bays for drives and other things.

In fact, a rather popular modification is to remount the entire ST motherboard inside a tall tower case and use an IBM keyboard interface adapter to connect a detached keyboard PC-style.

The problems with doing this are first, making sure the case you get is large enough to hold your ST motherboard (Mega STs are easier to fit), and second, bringing all the connections out from the ST motherboard to the standard connectors on the PC case.

Many of the ST connectors are not standard, so you have to come up with some way to plug in your monitor and floppy drives, but the connectors to make extension cables ARE available (try Best Electronics, whose phone number I've unfortunately lost track of at the moment).

Special PC style cases ARE made specifically for the ST, but unfortunately these are rather expensive by comparison with a $79 PC style tower case.

If all you want to do is mount a hard drive, an inexpensive PC case is ideal.

Well, I'm now installed at Logica in South London, so if anyone
has been trying to contact me, the address to use is:

gornalls@lgcp.logica.com

I'm in the process of getting news access, but this may take a
while, so email will be more likely to get a reply for the time
being...

I've still got the FTP site, so things are still welcome for
upload, though it may take a day or two to move from pub/ from
now on :-(

ATB,
Simon.

[PS: New Mega-archive (the 2nd volume) due out any time now :-]

I've recently got my hands on a nice 19" monitor and I've got it working
on my STe quite nicely, however, ST High res looks very blocky and
the text is too big to read. I would like to know something about reflex
graphics cards, or another graphics card which works on an STe with
a T28 accelerator and compatable with the operating system (MiNT).
I'd like a resolution of about 1280 x 1024 in monochrome. The price
can't be too much as I'm a student with no cash.

~~ What's the point of MS Windows, moving the power switch to
. the 'off' position is much quicker and easier!

FELDAK79@SNYONEVA.CC.ONEONTA.EDU wrote:
: Roger:

: In many ways the ST was ahead of its time. Don't forget that the machine was
: designed way back in 1985 using cutting edge technology and pretty much
: was thrown together in about 6 months.

I have 2 ST's and a Pentium 90, sure the Pentium is verry fast but as far
as ease of use goes the ST's blow the Pentium away.

: I only came back when the ST series was starting to show its age - when
: I needed to run certain programs for college classes, when I wanted to
: play games that were only available for the PC, and when I figured I could
: make more money working on game projects than I did on the ST line.

I only got the PC beacuse I just could not get the same software for the
ST, and not enough new software is comming out for the ST's any more.

: I'll agree with anyone who says the ST is superior to the PC as long as
: they're talking about a 286 or 386SX running Windoze as the difference
: between a 386SX/16 and a 486SX is alittle short of amazing.

Not to much of a difference between a 386DX/40 and a 486 SX/25 though.

: Probably my biggest gripe about the ST series when I was an owner, was that
: Atari locked you into its 320x200x16 low rez mode. Hell, my PCjr had
: the same gfx modes! Had Atari added a 256 color mode with the release of
: the Blitterized STe series, I might of kept my Atari. The TT had VGA
: video capabilities but the machine was FAR too expensive and the Falcon's
: are under-powered (much like a 386SX under Windoze).

I agree with you on this, and graphics cards for ST's are FAR to expensive,
I would have got one, but the price is nuts.

: Still, while I do enjoy my PC, I do miss my STs and the many fond memories
: I have of the machine. I might even pick one up again as my finances allow.

: Well, just my two cents...

I could not get rid of my ST, even though I hardly use it now. Would
miss it's many nice features to much.

1887. Re: help needed : upgrading ST memory

Newsgroup: comp.sys.atari.st
Date: 1995-05-01 00:00:00 UTC
From: BobR <76702.1466@CompuServe.COM>
Message-ID: <3o2fskfto3@mhafc.production.compuserve.com>
Source record: 166403

As I've mentioned here before, in my opinion the only really reliable and relatively inexpensive "upgrade" to the memory in 520 and 1040 ST computers is to buy a used Atari 1040STe...

The memory in a 1040 ST cannot be upgraded by "piggybacking" RAM chips onto the existing ones (a rather inelegant solution at any rate), so you need to obtain a third-party "upgrade board" to hold the extra RAM. Most of these use various bizarre methods of connecting to the motherboard which render the system less than totally reliable. Most of them are somewhat expensive too.

A used 1040STe is VERY easy to upgrade because (except for a few very early versions) they use industry standard SIMM modules which are easy and relatively inexpensive to obtain, and easy to install in the STe.

In addition, the STe comes with TOS 1.62, which is FAR better than the earlier versions (think of it as a FREE upgrade for your TOS), and has better graphics and sound.

Watch the "For Sale" ads here on UseNet, on local BBSs and in the local newspaper... I bought a used 1040STe with 4 Megs of RAM in it for $125 a little over a year ago. You could easily pay that much for the memory "upgrade board" that you still have to hack and slash your computer to install..

Source record: 166406

David:

Thank you for correcting any inaccuracies to my statements.

However, I do remember reading somewhere that the GI/Yamaha sound chip in the ST did have stereo capability it - hence, it was possible for the tweety board adapter to do its magic.

You're right that Atari did make a mistake in not publishing established interface guidelines for GEM. However, I think they also wanted to have programs appear as fast as possible for the ST - as GEM documentation was always sparse, this lack of a standard only helped get things released.

You're also correct in the ST's screen display being slow but that was only under GEM - as I'm sure you'll recall much of GEM was written in C and many parts of TOS were far from optimized. When programmers began to learn to write directly to the screen, things really screamed (remember TEMPUS?). The ST's video RAM organization, fast CPU, and good video architechture made the ST's graphics very fast - except when doing screen blits of large objects. For that time, only the Amiga with dedicated hardware could move sprites faster - and the Amiga had sluggish text output as well.

Although I didn't realize it at the time, Atari killed the ST series very soon after release for the simple fact that they did not make it EASILY expandable/upgradable. The Megas came out almost 3 years after the ST line made its appearance - by that time things were already starting to sour. Heck, one of the reasons why the AMiga line survived was because almost every model from the 1000 on had some expansion capability. Regardless of the market niche (home or office), computers are expensive - the ability to reliably upgrade a machine fends off obsolescence and reduces the cost of acqiring future technolgy. Apparently, the Tramiels were blind to this trend with the IBM PC and when they did regain their sight it was too late.

In their defense, I remember hearing that part of the reasons for the delays in updated ST hardware was the fact that their primary hardware engineer and creator of the original ST left Atari in some sort of a power struggle. I guess it was easier AND cheaper for them to just put bandaids on the system (i.e. new TOS, 4096 colors, etc.) than to release new and innovative hardware. The most exciting machine they ever released was the much heralded Falcon which I enjoyed for the 6 months I owned it. Yet, this machine was too expensive and far too underpowered. muhch t was

: Surely there's not much point without a brief review of each one. I
: wouldn't buy one just because it's on a list. Where to get it and how much
: would be useful too.

Brief reviews? Ok....

Ishar 1 - total crap, I'm sorry but its VERY slow and annoying for the most part and I wouldn't recommend it.

Ishar 2 - completely amazing, much faster, better graphics and better plot, well worth investing in.

Transarctica - its 'different' sort of a strategy train set simulation, some nice aspects to it, very nice graphics and sound but might get boring after a while if it doesn't grab your attention.

Llamazap - not as brilliant as most people think IMHO, but the graphics are slick, the sound is superb and there are plenty of usual Minter effects, you'll need a joypad though and it is very challenging 'ie read - difficult!'

Steel Talons - again a joypad is required (or there is a little program you can FTP which fixes it for joystick, but joypad is best) - very nice helicopter flight sim with a slant towards action and blowing things up than doing much else. Frame rate isn't all the stunning but the graphics are nice, the sound is adaquate and you can get a real feeling of a rush when flying low and fast through a canyon shooting the crap out of the tanks on the ground.

Towers 2 - this is a slice of shareware history for the Falcon if you ask me, great graphics and sound, very nice 'Wolfenstein' style game engine and plenty of things to do, people to duff-up and items to collect. Very system friendly, worth the download.

Pinball Dreams - its a classic to be honest, graphics don't seem to be as colourful as the A1200 version but basically the sound and playability remains intact. Challeneged only by Obsession but thats not Falcon

specific so I'm not going to list it here.

Bubble Bobble 2000 - coming very soon (hopefully commercially) the beta versions I have are stunning. Graphics are full True Colour and very attractive, playability is intact and its better than the arcade version if you ask me. Look out for it.

Ping 2000 - didn't like this one at all, sorry. Sort of pong does True Colour with lots of whizzy alien things flying around getting in your way. Nice enough graphics but the main problem is that the game works from left to right (ok ok I know Pong should!) but the screen just ain't wide enough and at the speed the ball moves its all over too quick. Suck it and see I guess, I didn't like the taste.

You can get nearly all of the above from 16/32 Systems, Merlin PD or Daze Marketing. All addresses in popular Atari magazines, usual price is 20-25 quid but Daze are known for doing good special offers. All games above are nicely packaged (except Towers 2) and come with proper manuals.

Hope that helps.

This is not right. The number of bits used to represent the mixed signal
is the same as each individual signal. Therefore, you are decreasing the
resolution of the input signals (or risk clipping).

Anthony McDonald (aa113@cfn.cs.dal.ca) wrote -

:: Probably my biggest gripe about the ST series when I was an owner, was that
:: Atari locked you into its 320x200x16 low rez mode. Hell, my PCjr had
:: the same gfx modes! Had Atari added a 256 color mode with the release of
:: the Blitterized STe series, I might of kept my Atari. The TT had VGA
:: video capabilities but the machine was FAR too expensive and the Falcon's
:: are under-powered (much like a 386SX under Windoze).
:
: I agree with you on this, and graphics cards for ST's are FAR to expensive,
:I would have got one, but the price is nuts.

It seems to me that this is when things started to go a bit wrong for
Atari. The rumors in the press were about a super ST that would support
256 colours. Instead, the STe came out basically the same as the STfm
and was a bit disappointment to all.

Just wondering what the differences would be between my ol' 1040STf and a Mega ST? Well, besides the obvious detachable keyboard and 3 megs extra RAM. :-) BTW: The Mega does have the cart. port does it not?

>Probably they'd turn to any one of thousands of auto mechanics and repair
>shops in their local area.

>What happens if they mess up their IBM compatible computer..? Same thing.

Nice metaphor. But what strikes me is that it is *so* easy to screwup
a PC. I don't consider myself computer-illiterate, and I've solved
many PC-problems for friends of mine (you'd be *amazed* how illogical
the solutions usually are... It's too crazy for words that the sole
fact that program B was installed suddenly stops program A from
printing, or whatever...) but the stupidity of some PC-stuff goes
beyond me. The brother of my girl-friend tried to upgrade his Windows 3.1
to WFW 3.11. He had DOS 5.0 installed, so he got 6.2. He sat down
behind the computer at about 2pm, thinking it would be done in a
breeze, but came down at about 11pm. The result of various tries was
that the computer couln't even find its harddisk. He had to reformat
it.

I won't say I never had problems with my Atari (mostly autofolder
stuff) but that always happened when I knew what I was doing and that
some `risk' was involved (as in: `I might have to change the order of
these two autofolder programs...'), not at all like `I'd better backup
my harddisk, because I might have to reformat it after installing this
Tetris version'.

Regards,

Thanks for the feedback. Thesea re TrueType fonts for the PC.

1900. Serial Port- No of stop bits?

Newsgroup: comp.sys.atari.st
Date: 1995-05-01 00:00:00 UTC
From: neilt@ftel.co.uk
Message-ID: <NEILT.95May1143012@collapsible-frink.ftel.co.uk>

I am trying to use the serial port on my ancient ST using the VT52
emulator program supplied on the ST Basic disc. However the manual
doesn't tell me how many stop bits are added. Any ideas where I can
find this info? . The RS232 config program supplied has a field
labelled strip bit which can be toggled ON/OFF but I dont know what it is.

The fastload bit works for ACCs as for normal programs.

Because the ROM AES itself has a bug (it relies on certain memory
blocks being zeroed).

1902. Re: ST ahead of its time?

I would just like to clarify some of the points you made.
No, this is not a flame.

>ST's Video - it was indeed a form of local bus video. Yes, it used DRAM for
>it video but that was because it used RAM from the system to store its video.
>However, unlike CGA equipped PC's, the ST was able to update the screen and
>the CPU at the same time.

The ST interleaved CPU and video's access to RAM, ensuring that there would
be no "wait states" by alternating CPU and video access.

>This combined with the ST's efficient screen ram
>arrangement allowed for VERY fast graphics (i.e. lines, boxes, simple blits).

I beg to differ. One of the major complaints of the ST was the slow screen
redraw speed. Keep in mind that this problem was caused by TOS, though. It
was not a hardware issue.

>ST's Sound Chip - certainly not the best. It was in fact the same chip
>that was used in the Colecovison game system. The C-64's SID was
>better but the Yamaha/GI chip used in the ST had stereo capability, ad
>noise generator and was still better than the Mac+'s 4 voice tone
>generator and much better than the polyphonic chip used in the IBMPCjr.

The sound chip was the weakest part of the orignal ST. It had 3 voices, and
had no stereo capability. It was capable of only square and triangular waves.
The Amiga sound chip is what should have been built into the ST.

>ST's interface - compared to the Mac+ it was childish but the ST didn't
>lock developers into anyone standard way of doing things either.

One of the things that makes any interface easy to use is standardisation.
Once again, this was a major problem with the ST. Atari should have set down
rules for the interface and promoted them extensively. As it was, there were
no rules or guidelines. This was a problem not only in terms of user interface,
but also in terms of compatibility. (Remember all the programs that failed
when TOS 1.4 came out?)

Having said all that, though, for its time the ST was truly incredible.
The ST was an incredible engineering effort. In approximately six months,
Atari designed from scratch a computer that was better than anything ouit
there at the time. The problem was that Atari didn't do anything with it.
After the 1040ST, they let the ST die. The improvements Atari made to the
ST line after that were all too little, and the ones that weren't came out
too late. Atari should have been continually improving its machines in
significant ways.

Found this saved from a few months back... some might find it helpful..

Robinsons Requiem Hints
=======================

The axes are found in the lake world

To get there you need to go out of the bottom right hand side of the first world and through the cave system - there are some nasty worm jobs in there so watch out. Crawl through the start and end of the cave system otherwise you will not be able to get through.

In this world there are several things - namely four tigers, a robinson with a lazer pistol which you can get if you kill him (use the arrows - it took me ages!!!!), and several goatmen and some arrow firing centaurs

Thee goatmen etc can be found up the hill if you go due east when you enter the world - they are tough so be prepared!!!! they will all drop 'hatchets' which are alot better than the knife - the monsters in the amazon world only need a couple of hits!!!!

There is also a raft which you can float around on and some artichokes growing by the lake - these are good for you so colect as much as you can carry for snacks!!!!!

Good luck!!!

HipSTer

Oh so people think that other countries know how to make computers ? Bugger off if you call makeing PC Clones makeing computers you are sadly mistaken. The ST/Amiga/Apple all have better H/W designs than the old PC, its just that by some mistake the PC dominated the business world and now this has moved to the games/home market.
